At a meeting of the Society of Natural Sciences, Neuchâtel, Switzerland, mention was made of Dr Tyndall's experiments on the transmission of sound, on which a member remarked that it had long been known that sounds are better transmitted in cloudy than in clear weather. During autumnal fogs the noise of the town is heard on the adjacent hills at elevations where the same noise cannot be heard in the summer. And as an example of another kind it was mentioned that two persons talking through a bonfire could scarcely hear each other, owing to the deviations produced in the sonorous waves by the heated column of air.

Geologists have been considering certain evidences which seem to prove that about five hundred years ago large tracts of land around the coast of Jersey became submerged. Remains of forests can still be seen at low-water; and an ancient littoral parish is now represented by a reef of rocks. There is a tradition that in the fifth century Jersey was separated from the mainland by a narrow strait only, crossed by a bridge. As regards the disappearance of land, it is known that during the earthquake in New Zealand in 1865, rising and sinking of tracts of land took place within twenty-four hours. The Director of the Geological Survey of New Zealand shewed that forests might be submerged by encroachments of the sea as well as by sinking of the land. The town of Graymouth, he said, was built on a spit of land at the mouth of a river, this spit being chiefly composed of drift-timber. After a while the inhabitants began to dig out the timber for fuel, which weakened the spit: the sea broke in, and the town was washed away.

A small book published by authority of the New Zealand government—*Reports on the Durability of New Zealand Timber*, gives a description of the various kinds of trees that grow throughout the colony, with particulars of their quality. The kauri ranks as the best; the totara stands next, followed by the rimu and other kinds of pines, the tanekaha, the cedar, birch, and the rata, or ironbark. And this information is supplemented by an account of experiments on the several kinds of timber.

ON A SPRIG OF HEATHER.

MRS GRANT, the author of the following verses, was born in 1754. Besides verse, she wrote several able and interesting prose works, her *Letters from the Mountains*, and *Essays on the Superstitions of the Highlanders*, displaying a lively and observant fancy, with considerable powers of landscape-painting. Her writings first drew attention to the more striking and romantic features of the Scottish Highlands, afterwards so fertile a theme for the genius of Scott.

Flowers of the waste ! the heath-fowl shuns
For thee the brake and tangled wood—
To thy protecting shade she runs ;
Thy tender buds supply her food ;
Her young forsake her downy plumes,
To rest upon thy opening blooms.

Flower of the desert though thou art !
The deer that range the mountain free,
The graceful doe, the stately hart,
Their food and shelter seek from thee ;
The bee thy earliest blossom greets,
And draws from thee her choicest sweets.

Gem of the heath ! whose modest bloom
Sheds beauty o'er the lonely moor ;
Though thou dispense no rich perfume,
Nor yet with splendid tints allure,
Both Valour's crest and Beauty's bow
Of thee hast thou decked, a favourite flower.

Flower of the wild ! whose purple glow
Adorns the dusky mountain's side,
Not the gay hues of Iris' bow,
Nor garden's artful varied pride,
With all its wealth of sweets could cheer,
Like thee, the hardy mountaineer.

Flower of his heart ! thy fragrance mild
Of peace and freedom seems to breathe ;
To pluck thy blossoms in the wild,
And deck his bonnet with the wreath,
Where dwelt of old his rustic sires,
Is all his simple wish requires.

Flower of his dear-loved native land !
Alas, when distant far more dear !
When he from some cold foreign strand,
Looks homeward through the blinding tear,
How must his aching heart deplore,
That home and thee he sees no more !

TO THE READERS OF CHAMBERS'S JOURNAL.

THE conductors have to announce that *'Fallen Fortunes'* will be completed next month. The story entitled *Following up the Track* will also be finished.

In October, November, and December will appear, in addition to the usual miscellaneous matter, certain shorter tales or novelettes of interest ; and in January 1877 will be commenced an ORIGINAL SERIAL NOVEL, to extend over some months.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

MORAL TRAINING.

THE theory that in the growth of every individual may be traced the history of the race—that in early years we all pass through that phase of character exhibited by the uncultured race from which we are descended, is one which seems to be in a great measure verified by experience. Hence, perhaps, the tendencies to cruelty, falsehood, and various other vices which we see in very young children. There are, it is to be hoped, few men who would not blush at acts of cruelty they committed when boys at school. We must not then expect too much from young people. Care should be taken not to force their moral nature; for moral precocity has detrimental results as well as mental precocity. That this is so is already recognised in the saying, 'Children will be children.' When they become men they will put away their childish barbarities with their toys. Maturity turns sour crabs into sweet apples. We must give Nature her time, and expect much from growth.

Be sparing, we would say, of giving commands to children; that is to say, be quite sure that a thing ought to be done or left undone before you give your orders. Let us remember that it is possible to overstrain the undeveloped moral principle; and that when we invent virtues and vices, or make our own crotchets and selfishness the standard of these, right and wrong come to be words without meaning to a child's mind. When too often repeated, the order, 'Thou shalt' is apt to provoke 'I won't.' The vice of over-regulation is, that it produces only hot-house virtue in yielding natures, while it stirs up the independent to rebellion. Before giving orders to a child, we should be sure that these orders are not suggested by our own selfishness, but from regard to the child's profit, and also that the thing required is necessary, rather than some vexatious artificial duty. But when we have decided these points, nothing ought to make us shrink from requiring our commands to be promptly obeyed. We render ourselves contemptible in the eyes of our children when we make rules in

haste and repent at leisure; when we get angry and laugh at the same action as the passing humour dictates; when we encourage them to transgress by the prospect of probable impunity.

That government is the most efficient and most respected by all citizens, dishonest as well as honest, which inflicts the lightest possible punishments consistent with justice and public order, while at the same time it imitates Nature in the regularity and certainty with which it causes its penalties to follow. That it is not severity of punishment so much as certainty and consistency in its infliction which inspires respect, is proved by the fact that the law was never less a terror to evil-doers than some years ago, when jurors would not convict, because their consciences taught them that the punishments to be inflicted were excessive. 'In brief,' says Mr Herbert Spencer, 'the truth is that savageness begets savageness, and gentleness begets gentleness. Children who are unsympathetically treated become unsympathetic; whereas treating them with due fellow-feeling is a means of cultivating their fellow-feeling. With family governments, as with political ones, a harsh despotism itself generates a great part of the crimes it has to repress; while on the other hand, a mild and liberal rule both avoids many causes of dissension, and so ameliorates the tone of feeling as to diminish the tendency to transgression.'

We cannot have a better guide as to the proper method of punishing children than Nature herself. Instead of the artificial punishments too much in vogue, more natural ones should be substituted. As the natural evil consequences of our actions are our best discipline, so children would better understand and respect their parents if they punished them not artificially, but naturally; that is to say, if they let them punish themselves. Jane is always unpunctual when the hour comes for her walk; now, to slap her would be to inflict an artificial punishment, which she will not understand nearly so well as if she were some day left at home, and it were pointed out to her that her brothers and sisters started without her because of her own carelessness. Edward commits assault and battery

on his sister's doll; to send him to bed would not appear so just and natural to him as to stop his pocket-money in order that a new doll may be purchased. These illustrations may explain the difference between natural and artificial punishments. The former are certainly more just and tend to maintain better terms, so to speak, between parent and child. Parents who warn children as to the consequences of their actions, while at the same time they use these consequences as means of punishment, are looked upon as friends and preservers, rather than as 'friend-enemies.' And when the dangerous period of transition from boyhood to manhood approaches, the boy who has been made to experience the natural effects of his deeds, instead of being worked upon like a puppet by some hidden machinery, will go out into life full of independence, and capable of governing himself.

Let parents teach their children the highest conception of God's nature their hearts can conceive. Let them never say that things are more certain than they really are, lest they come in after-years to be thought less certain than they are. Let them teach principles capable of expansion rather than stiff formulas, which after all are not truth itself, but only the shell in which it is contained. Were this method of instruction more frequently adopted, the shock of controversy would not put young intellects off their balance, and fewer men and women would be found living without God in the world.

The problem for parents and teachers to solve seems to be this, how to win the respect of their children without losing their confidence. Many parents are respected by their children as eastern monarchs are respected; but they never hear a word of those secret doubts and troubles which torment youth, only because they are not explained away and set right by the sympathetic experience of older heads. From what a number of scrapes, and even flagrant sins, might not a father save a son whose fullest confidence he had obtained! The fact is, however, few of us sufficiently remember our own early days to be sympathetic friends and confidants to our children. If we could do so better, we might save them from many of youth's pitfalls.

Our mind calls up a few fathers of our acquaintance who are perfectly companionable to their sons, joining them in their pleasures, being consulted by them in every difficulty, and all this without in the smallest degree losing their respect. Isaac Walton, speaking of George Herbert's mother, says: 'She governed her family with judicious care, not rigidly nor sourly, but with such a sweetness and compliance with the recreations and pleasures of youth, as did incline them to spend much of their time in her company, which was to her great content.' Surely the children of such parents must feel in honour bound to do their best to pay that immense debt of gratitude which children owe good parents.

We conclude this paper with an instructive quotation from a book that should be read by every parent and teacher—Mr Herbert Spencer's *Education, Intellectual, Moral, and Physical*. 'Lastly, always recollect that to educate rightly is not a simple and easy thing, but a complex and extremely difficult thing, the hardest task which devolves on adult life. . . . You must be prepared for considerable mental exertion—for some

study, some ingenuity, some patience, some self-control. . . . It will daily be needful to analyse the motives of juvenile conduct—to distinguish between acts that are really good, and those which, though simulating them, proceed from inferior impulses; while you will have to be ever on your guard against the cruel mistake, not unfrequently made, of translating neutral acts into transgressions, or ascribing worse feelings than were entertained. You must more or less modify your method to suit the disposition of each child, and must be prepared to make further modifications as each child's disposition enters on a new phase. . . . Not only will you have constantly to analyse the motives of your children, but you will have to analyse your own motives—to discriminate between those internal suggestions springing from a true parental solicitude, and those which spring from your own selfishness, your love of ease, your lust of dominion. And then, more trying still, you will have not only to detect but to curb these baser impulses. In brief, you will have to carry on your own higher education at the same time that you are educating your children. Intellectually, you must cultivate to good purpose that most complex of subjects—human nature and its laws, as exhibited in your children, in yourself, and in the world. Morally, you must keep in constant exercise your higher feelings, and restrain your lower. It is a truth yet remaining to be recognised, that the last stage in the development of each man and woman is to be reached only through a proper discharge of the parental duties. And when this truth is recognised, it will be seen how admirable is the arrangement through which human beings are led by their strongest affections to subject themselves to a discipline that they would else elude.'

FALLEN FORTUNES.

CHAPTER XLIX.—DOES KITTY KNOW?

IN Brown Street, Islington, was probably a happier reunion that evening than any which took place in more fashionable quarters of the town; yet it was a happiness tinged with deepest sorrow. Dalton's return brought with it to his children a keen sense of the loss of her who would have given him his fittest welcome; and when his eyes rested upon his remaining dear ones, he missed his Edith most.

His first question, after his greetings with Jenny and the rest were over, was, 'Where have they laid her?' and he felt pained and sorrowful when he learned that it was at Sanbeck, hundreds of miles away; whereas, had it been possible, he would have visited her grave, and wept over it, that very night. They told him too, at his own desire, of her illness and death: how she died, as it were, for very love of him, since the shock of his reported death had killed her. He was silent for many moments, sunk, as it seemed, in a stupor of grief, when Kitty stole from the room and brought down the babe—his Edith's precious legacy, and placed it in his arms.

'We four are still left to you, dear papa,' said she. She herself had been supported in her affliction by the sense that others were dependent upon her, and she hoped it might be the same with him. And so it was, though in a less measure. He presently grew himself again, and began to ask them about this and that.

'I hope the folks at Riverside have been kind to you, my darlings, since you have been all alone!'

'They meant to be kind, I think,' said Kate.

'Meant to be kind,' repeated her father, frowning. 'There is no difficulty about expressing kindness. At least Philip here found none, I know, in my case.—Is there anything amiss with the Campdens? What have they done, Jenny?'

'Nothing,' answered Jenny sententiously.

'We did not like the manner in which Mrs Campden behaved to us, after mamma's death,' explained Kitty: 'it was more manner, perhaps, than anything else; but our hearts were sore, and easily hurt.'

'Jenny, tell me,' said Dalton. 'That woman has behaved badly to you. Is it not so?'

'Not only "that woman," but the whole family, in my opinion,' returned Jenny dryly.

'Surely not Uncle George?'

'Uncle George is nobody at Riverside; if he had been anybody, there is no saying what might have happened; but he is not. It is a wretched story from beginning to end, and they are wretched people.'

'If it be so,' said Kitty reprovingly, 'do not let us talk about them, on a night like this.'

'I am sure I never wish to mention their names,' answered Jenny.

'But do you mean to say,' said Philip, 'that these friends of your father's—rolling in wealth, as I understand they are—never held out a helping hand to you, Jenny?'

'My dear uncle, you don't understand the matter; you should get Mrs Campden to explain it to you, as she was good enough to do to us: "Rich people have so many calls!"'

'If this is as you say, I will never set foot in that woman's house again,' exclaimed Dalton angrily.

'That will be one call the less for her,' observed Jeff pleasantly.

'And the Skiptons? Have you seen nothing of them too?' inquired Dalton.

'My dear papa,' said Jenny gravely, 'you can't expect folks who respect themselves—or who wish their coachman to respect them—to bring their carriage to Brown Street. It is no good asking after our old friends, for, except dear Dr Curzon, and those now under this roof, we have none.'

It was a relief to Kitty that not a word was said about Mr Holt, though of him it could certainly not be averred that he had deserted them. To her, terrible as it might seem, and did seem to her own mind, the return of her father was not an unmitigated joy. When Jeff had informed her of it, she had not evinced the delight he had expected, because the thought had flashed upon her, that so far as she was concerned, he had returned too late. She was not indeed pledged to Holt, but she felt compromised as respected him, and in honour bound to accept him as her future husband. For some days past her mind had been made up for the sacrifice, and she had already plunged into little expenses upon Jenny's account, in anticipation of it. The money that was to take her sister to the sea, and bring back the roses to her cheek, and which Holt had offered, she had resolved not to decline. She was already under a pecuniary obligation to him in the matter of the premium, which could only be discharged in one way; for, to judge by the appearance of her father, he had come back even

poorer than he had left England. Well, she would now be able to help him as well as the rest—four of them, instead of three—that was all.

Still it was a relief to her that not a word was spoken about the man the thought of whom was ever present with her, and shadowed her young life with gloom and evil presage. In vain she had called up every argument to strengthen his cause and back the claim she felt to be unanswerable: his solicitude for her and his; his generosity; his patience and forbearance. The very constancy with which he clung to her, and pursued her, ranged itself upon the other side, and increased her sense of repugnance, nay, of loathing.

It was a part of the plan agreed upon between Dalton and Philip that they should say no more for the present about Holt and his transactions than they should be absolutely obliged to say; and it surprised them both to find how easy it was to maintain their reticence. Neither Kitty nor Jenny asked their father one word about the *Lara*, nor put a question respecting his pecuniary affairs. It is true they had taken it for granted that matters were the reverse of prosperous with him, which would have been a sufficient reason for avoiding the subject; but in any case—poor though they were and suffering from the ills of poverty—such material woes were for the moment forgotten in the joy of seeing him back again.

'I think I have reason to be proud of my darlings, Philip,' said Dalton, as the two walked together with Jeff from Brown Street that night to the lodgings which that young gentleman had procured them near his own. 'I had ruined them, and as it must have seemed to them' (he pointed to his shabby coat), 'had failed in saving anything from the wreck of their fortunes, yet not a syllable have they spoken to me upon the subject, lest, doubtless, it should sound as a reproach.'

'I expected nothing less,' answered Philip quietly. 'I feel several inches higher since those two girls have called me Uncle. They have nothing sordid about them, such as I, alas! have seen in my fellow-creatures all my life.'

'And it isn't as if they had not to think of shillings and pence,' put in Jeff eagerly. 'If you could know how Kitty has cut and contrived, and striven to make both ends meet, during the last six months!—Here he stopped, for a look of intense pain came into Dalton's face.'

'Well, well; that will be all over now, I trust, Jeff. To-night, we have still to do some dirty work, and then we shall have clean hands for the future; we will avoid rogues and fair-weather friends, and all worthless folk; and my dear ones shall have no further cause for tears.—I think Jeff should know what we are going to do with respect to Holt, Philip.'

Their plan of attack, unfolded to their young friend, at their lodgings, was simple enough.

A letter was to be posted to Holt that night informing him that his fraud respecting the *Lara* mine was discovered; and that his malpractice respecting other affairs of Dalton, of which he had had the management, was more than suspected. Restitution was imperatively demanded; and in default of it, he was assured that criminal proceedings would at once be instituted. There were no upbraidings; but a more curt, decisive, and stern epistle was never penned.

Philip would have preferred that their opinion

of Holt's treachery should have been stated in Saxon English; but Dalton would not have it. Such a course, he thought, would have taken for granted a certain familiarity to still exist between him and this scoundrel, of whose connection with himself he felt unspeakably ashamed.

'What makes me mad with him,' said Philip, 'is to think he should have dared to lift his eyes towards Kate. Such vermin ought to be poisoned out of hand.—What do you say, Jeff?'

'I am bound to say,' returned the young fellow gravely, 'that Mr Holt whatever may have been his reasons for it—has been considerate, and even kind, to me.'

'But you are not going back to him, surely, after this?' said Philip, in amazement.

'Well, yes; I shall go to-morrow, for the last time: he may have something to urge, I do not say in excuse, but in extenuation of his roguery. Your letter gives him no opportunity for this.'

'Opportunity indeed!' rejoined Philip, with irritation. 'I would send him a rope, to afford him the opportunity of extenuating himself on that. If you get talking with that wily scoundrel, my young friend, you will be wound round his little finger.'

'Our Jeff—being honest—contends at a disadvantage with most people,' observed Dalton, laying his hand on the young fellow's shoulder; 'yet in the end, I should be inclined to back him. Let him take his own way, and we will take ours.'

Accordingly, Jeff went to Abdell Court next morning, as usual. Mr Holt had not arrived; nor, said the office boy, had he yet returned from the country. Upon his table was lying the usual pile of letters, which it was Jeff's business to sort and dispose of. Some he was empowered to open and answer; some he would open only and make an 'abstract' of for his employer; others he would put aside for his private eye. Among these last was one in Dalton's handwriting, with the contents of which, however, Jeff was already acquainted.

Eleven, twelve o'clock passed, and yet Mr Holt came not. It would not have been surprising had his real destination of yesterday been what he had pretended it to be; but Jeff was well convinced that he had not gone to Plymouth, but to Liverpool, and there was now ample time for him to have gone and returned. At one o'clock the office closed for an hour, during which Holt was accustomed to deny himself to everybody, whether he was within doors or not; and a little before one he came. He looked jaded, wan, and pale, like one who has been on a toilsome expedition, and failed in its proposed object—or so it seemed to Jeff, who observed him narrowly—but there was no other change in his appearance, no cowed or defiant looks, such as might have been expected, had he known that Dalton had landed upon English soil. Jeff felt sure he did not know.

'Well, what news, Mr Derwent? Who has been?'

'Mr Dawkins called just after you went away yesterday, and appeared to wish to see you very much.'

'What about?' inquired Holt quickly. 'But it's no matter. It was most likely about that cock-and-bull story about the *Flamborough Head*. I daresay you have heard it yourself, Mr Derwent?'

'I have heard that some one—two persons indeed have been saved from the wreck.'

'Well, it's true, for a wonder: Jones and Norton are their names. I am sorry to say their story destroys the last gleam of—What's this?' He had been sorting the letters with his hand, and presently came upon the one despatched from Islington the previous night. 'What's this?' he reiterated, in a voice grown suddenly hoarse and low. 'How did it come? Where did it come from?'

'It came by the early post, sir.'

'It's strange,' said Holt, with an air of indifference; 'quite curious. Have you ever seen a handwriting like that? It reminds me of one who certainly never could have written it; and yet it gave me quite a turn. You know whom I mean, I daresay?'

He did not attempt to open the letter, and the strong huge hand that held it in its grasp shook like a leaf.

'I know whom you mean,' said Jeff gravely. 'It is Mr Dalton's.'

'Yes; it is like John Dalton's writing.'

'It is his writing, sir.'

'That is impossible; that is ridiculous. The post-mark disproves that. But there is a curious similarity, without doubt.—Has the boy gone to his dinner?'

Jeff answered that he was; and Holt moved to the door and looked it.

'Now tell me, Mr Derwent,' said he, still toying with the letter—'for you are one who tells the truth—what makes you fancy that it was really Dalton who wrote this? As a matter of fact, as I have already stated, there were but two men saved from the wreck of the *Flamborough Head*.'

'I know it, Mr Holt: they were John Dalton and Philip Astor.'

'That's a lie—that's a lie!' exclaimed the other passionately. 'You are a liar, like the rest;' but his pale face belied his words; he staggered rather than sunk into his chair.

'You had better open the letter, and see who is the liar,' said Jeff haughtily.

'You speak of Astor, but you don't know the man as I do,' continued Mr Holt. 'He is an utterly untrustworthy and contemptible fellow. He was here once, in your place; and I trusted him too far, and he repaid me for my confidence by forgery. He is not to be believed upon his oath. If there is anything in this letter founded upon his evidence'—

'You had surely better read it, Mr Holt,' said Jeff curtly. He could not but feel some pity for this miserable wretch, who evidently dreaded the thing he held in his quivering fingers as though it were a very adder.

'What! you know its contents, then?' exclaimed the other sharply. 'You are in the conspiracy with Astor and the rest. You think it honest, do you, to take your wages here, and turn against the hand that pays them?'

'I know what is in that letter, Mr Holt; but yet I am no conspirator,' answered Geoffrey steadily. 'On the contrary, I came here to day—for the last time—to do what good I could for you. As for your wages, they were paid for work, I suppose; or if that was overpaid, you had your reasons for it; but I owe you thanks for civil treatment, and I am here to give them.'

Holt had opened the letter by this time, and ran his eye through its half-dozen pregnant lines.

'It is not Astor's word that Mr Dalton has taken, you see, sir,' continued Jeff, 'but the evidence of his own senses. He has been to Brazil, and seen the *Quito*. As for the other matters, you know best; but'

'Ay, it is all over,' murmured the other. 'It is no use holding on to a falling stock, Mr Derwent, eh? That's one of the great principles of our business.' Holt was looking at Jeff, and speaking to him, yet he seemed almost unconscious of his presence: his eyes had no speculation in them; his tones were mechanical. Presently he cried out, like one who is wrong with a sharp physical pain: 'Does Kitty know of all this, Jeff.'

GOSSIP ABOUT CUTTLE-FISHES.

THROUGH the establishment of salt-water Aquaria, people are beginning to have correct notions of Cuttle-fishes, their habits, and appearance. We call them fishes, but they bear no resemblance to fishes with scales, which propel themselves through the water by the agency of tail and fins. Strictly speaking, they are not fishes at all. They are very nearly related to our familiar oysters, cockles, whelks, and other molluscs. Cuttles, like oysters, are 'shell-fish,' in the true acceptance of the term—only that the cuttle-fish, in the great majority of cases, has its shell inclosed *within* its body, instead of being an external and protective structure—and the bodies of both animals, with those of all other molluscs, are built up on one great plan of structure. The chief characteristics or modifications of this plan in the case of the Cuttle-fishes, consist in the elongation of the skin or 'mantle' in the neighbourhood of the head, to form the arms or tentacles so distinctive of these beings; the extension of this skin to form various kinds of fins; and the presence of a tube or 'funnel,' opening just below the head in front, and through which the water used in breathing is ejected. By this latter means the Cuttle-fishes propel themselves backwards in the water, on the same principle that a cannon recoils after a discharge. And we still remember with delight the summer day when we first witnessed a shoal of Common Squids careering through the calm waters of the Firth of Forth, propelled backwards by the *jets d'eau* from their funnels. The sharp hinder tip of the body just protruded, like the prow of a vessel, above the surface, whilst the head and rest of the body were below.

The best known kinds of Cuttle-fishes, and those which have been kept in our aquaria, are the genera *Sepia*, *Loligo*, *Sepioida*, *Octopus*, and *Eledone*. Of the first genus, the Mediterranean *sepia*, sometimes found on our own coasts, is a very familiar species. The *Loligos* include the well-known Squids, and the *Sepioida* are nearly allied to the *sepia* itself. The *Octopi* are the most famous of aquarium-inhabitants, and differ from the three preceding kinds in possessing eight arms only; the former possessing ten arms, of which two are longer than the others, and are provided with suckers at their extremities only. The *Eledone* is also an eight-armed cuttle-fish, and a very familiar species of this genus is the *Eledone moschata*, so named from the musk-like odour it emits.

The domestic life and economy of the Cuttle-fishes reveal some interesting and anomalous features as exhibited in aquaria. We some time ago received some interesting particulars regarding the pranks of some octopi which lived in Dr Dohrn's famous aquarium at Naples. Three octopi shared a large tank with three lobsters; the six being original proprietors and tenants of the miniature sea. Any new comer, however nearly related he might be to either the Crustacean or Cuttle-fish tenants, was invariably received with demonstrations of the most hostile nature. A lobster and octopus battle is certainly a novelty in the way of animal combats, but such a fight actually occurred in the Naples arena. A lobster-giant, who had previously exhibited his prowess in crushing with his great pincer-claws the skull of a turtle, as easily as if the reptile's head had been a nut, was introduced into the happy family circle in the octopus tank. Immediately, the largest octopus gave battle to the crustacean; the lobster, early in the fight, seizing one of the soft, pliant arms of his opponent in his claws; the octopus managing, however, after a time, to withdraw the captured member. Day by day the combat dragged out its weary length, sometimes one side being temporarily victorious,—as when the lobster lost a large claw—and sometimes the other. At last the combatants were separated, the lobster being placed in a new and unappropriated domain in an adjoining tank.

Now comes the strangest part of the history; for the octopus, as if seized with the passion, which, if exhibited in humanity, we should term one of 'dire revenge,' climbed over the partition separating the tanks, seeking his enemy, and, having found him, proceeded to wage war anew. The result was most disastrous to the crustacean, for the octopus was found, we are told, with the lobster in his clutches, literally torn into halves. Thus, to natural ferocity, we find the octopus unites immense agility and a stolid persistence. This same cuttle-fish extended no sympathy to his own species; for when two others—in addition to the two who had from the first been his companions—were introduced into his tank, he chased them from the water, and forced them to take refuge on the dry rocks above. Another octopus, in a British aquarium, pulled out the plug of his tank, and brought death on himself and all his companions in a single night.

Some interesting observations have been recorded regarding the propagation of these creatures. Like other Molluscan forms, they reproduce their species by means of eggs. Some Cuttle-fishes, such as the Squids and Sepie, do not mount guard over their eggs, which, like those of some molluscs, are inclosed within tough capsules, and are aggregated into masses known to sea-side visitors by the name of 'sea-grapes,' and the like. The octopi, on the contrary, make a nest of large stones, and therein inclose and guard their eggs which, however, are not encased in capsules—with jealous care. The female is thus exceedingly careful of her progeny, and continually pours upon the eggs currents of water from the 'funnel,' the presumed object of this latter procedure being that of keeping the water around them in a duly aerated state. The male octopus appears, unfortunately, to be afflicted with cannibal-like propensities; for we grieve to learn that one of the chief cares of the anxious mother is to ward off

the attacks of her unfeeling spouse in his endeavours to make a repast of their united progeny.

As may be imagined, the Cuttle-fishes are very well provided in the way of organs of sense and perceptions. Their large prominent eyes are well adapted for acute vision amid their dull watery abodes; and no less acute are their hearing powers. For, although destitute of outer ears, they yet possess well-developed internal organs of hearing. The sense of touch may be subserved by the muscular arms and their suckers, which may be made, as we know, to move with great rapidity, and in all conceivable directions. And as to the 'emotions' of our Cuttles, strange as it may be thought, their feelings of anger and of pleasure may be tolerably easily guessed at by watching, as in the human subject, the play of colours on their skin. Not only does our cuttle-fish blush, but he may literally blush almost any hue he pleases; this property of changing colour residing in the little colour-cells that lie beneath the delicate transparent outer skin. By altering the position of these cells, various and rapidly-changing hues of colour are produced; and the famous kaleidoscopic power of the chameleon is, in truth, thrown completely into the shade by the talents, in this respect, of the lower Cuttles.

Besides certain members of the Cuttle-fish group becoming immensely developed in size over their ordinary neighbours, and appearing as veritable giants of their race, these animals present another point of remarkable interest. Stories of gigantic Cuttle-fishes, as every classical scholar knows, are frequently to be met with in the records of the ancient naturalists. Indeed, there are very few maritime countries in which, under some legendary name or other, the histories of giant members of this group may not be met with. The 'Polypus' of the ancients, the 'Kraken' of the Scandinavians, the 'Pieuvre' of the Channel Isles, and the 'Devil-fish' of Victor Hugo, are all so many names expressive of a belief in giant Cuttles, the powers of which, as may be guessed, are never understated in any of the stories or legends referred to. Until very recent times, naturalists were inclined to be sceptical regarding the truth or probability of such stories. Stray examples undoubtedly had occurred now and then, of fragmentary portions of what must have been at any rate exceptionally large Cuttles, being found. But it was often difficult, or even quite impossible, to separate the grains of truth which might be contained in any tale, from the copious husks and chaff with which the fertility of human imagination, together with the natural lapse of time and frequent repetition, invariably tend to surround the original germ or incident.

In Captain Cook's first voyage, however, the remains of a giant cuttle were found; and parts of this specimen, preserved in the Hunterian Collection of the London College of Surgeons, shew that its total length must have exceeded six feet. A very large specimen was met with in 1861 between Teneriffe and Madeira by the French corvette *Alecton*, the length of this specimen being estimated at about fifty feet. But more lately still, the carcasses of several very large Cuttle-fishes have been met with off the coasts of Newfoundland; and a photograph representing the head and tentacles of one of these specimens now lies before us. The tentacles or arms were ten in number in this case. Two were elongated, as in the Squids, these measuring

twenty-four feet in length. The eight shorter arms each measured six feet in length, and ten inches in circumference at their bases, where they joined the head. The ten arms were provided with about eleven hundred suckers; and the eyes measured each four inches across.

The question which at once presents itself to naturalists for consideration on inspecting such a form, is, whether or not it constitutes a new species, or is merely a giant member of an already known one? For ourselves, we should hesitate to construct a new species without satisfactory evidence of more marked deviation from any type than that afforded by mere size—always a delusive test with regard to animal structures. But the mere occurrence of these monsters is in any case of exceeding interest, as opening up a new field for discovery, which may in time tend to throw light even on the great 'sea-serpent' mystery itself. Why, if giant Cuttles really exist, may not giant snakes also exist—largely developed individuals of one or more of the numerous species of sea-snakes known to exist in warm seas? Zoology at least offers no objection to the latter hypothesis. And after all, in Cuttle-fish history, as in most other things, the truth is certainly stranger than the fiction.

FOLLOWING UP THE TRACK.

CHAPTER X.

THE witnesses to prove the statement of the counsel for the crown were then examined, including Maurice Power; and they substantially and in detail established all the facts upon which so much stress had been laid; and all the ingenuity and educated intelligence of Mr Supple failed on cross-examination to discover any weak point. Mary Dwyer, who had but partially recovered from the startling announcement which disclosed by whose hand her cousin had met his doom, wept bitterly as, with touching emotion, she narrated the parting of her kinsman and lover in company with the prisoner; but although she felt most painfully that her testimony was bearing so terribly against the good fame of him for whom she would have sacrificed everything, there was a duty to her conscience, her country, and her God that had to be discharged, even if the result was to gratify the man by whose hand she had that day learned her cousin had been slain.

Even in this year of 1808 was Brien Spelassy's counsel dumb by the cruel policy of the existing law. He could not, like the astute person who opened the case for the prosecution, endeavour to explain away in a speech the facts pressing so heavily against the accused, whom he was bound at any sacrifice, save that of honour, to protect. With every prejudice to encounter which so foul a charge of murder would naturally create, he had been compelled to enter into the judicial combat fettered and restricted in action and in utterance; and although since the time with which our story is conversant, a change in this unjust system of procedure has taken place, the last word is still the privilege of the prosecutor, and not for the man whose life lies trembling in the judicial scales.

The first person produced for the defence was the lad Clover, the assistant in the establishment

of Mr Stephen Meagher, one of those sharp, precocious individuals who have never known what it is to be a child. Cool and collected, after being sworn and taking his position in the chair appropriated to the witnesses, he leisurely surveyed the judge and the other celebrities in the court, especially Mr Travers; and in answer to the questions put to him, proceeded to state how on the evening of the murder Maurice Power came to the inn and asked to see his muster, who was not then at home.

'Can you say,' asked Mr Supple, 'about what hour he came, and how long he remained on that occasion?'

Clover paused for a minute or so, as if to insure the greatest accuracy, and then replied: 'He came about seven o'clock; and about half an hour after the clock struck eight, went away; and the reason I made my remarks as to the time was that he told me he had a long distance to go to the Glen.'

'How did he happen to mention this?'

'Because I said to him it was strange if his business was so pressing with Mr Meagher, as he told me it was when he first came into the house, that he should not wait after stopping so long, and that I expected my master might soon come back. Another thing which made me take particular notice was when he told me he had a long distance to go, I wondered if he would be able to make his way, as he was heavy in drink when starting, and scarcely able to stand.'

'If that person presumes again to interrupt the business of the court, he must be taken into custody,' was the peremptory mandate of the Chief-justice, as Maurice Power, in his excitement, exclaimed: 'Oh, the perjured villain! He has forsworn himself; and he knows it. He has been put up to this.'

The lad, with the most innocent expression his face could assume, in defence of his veracity replied: 'It is the truth indeed, and nothing but the truth I am telling, as the blessed saints know.'

When it came to Mr Travers to cross-examine the witness, there was not to be detected the least variance from his original account; and when his accuracy in reference to the particular night he had been speaking of was sought to be put in issue, there was persuasion in his manner as he answered: 'Why should I be speaking of another and a different night? Sure we all heard the next day of what happened at the poor man's place; and there wasn't a deed done like it for months before or after, the saints be praised!'

At the suggestion of those acting for the prosecution, the judge permitted Clover and Maurice to be confronted; and the latter declared with great solemnity that he did not leave the inn till after midnight—that no one saw him depart, as the house was in silence and darkness, and the outer door locked and bolted—nor was he aware of having had anything to render him drunk; but when he awoke from a sound slumber, he felt as if the liquor he took must have been drugged.

An incredulous smile was the reply of Clover to this explanation, and he muttered to himself, but so loudly that the jurors might be, as it were, unconsciously taken into his confidence: 'Sure the poor fellow must be dreaming, or his troubles have made him flighty.'

Mr Supple seemed much pleased with the impression created by his first witness, and then, as if quite casually, asked: 'Do you recollect at what hour the prisoner came in that night?'

'Well, myself does not very well know, for he had to go at dusk to Mick Gleeson's, a good start off, to have a horse shod, and this delayed him, for Mick was not well at the time, and more-betoken he is since dead. I don't mind exactly when he came back; but the house was shut up at ten o'clock, and I handed the keys to the master, then in the parlour, and the prisoner was at that time discoursing with him.'

'Did you see him afterwards on that night?'

'His bedroom was inside mine, and I went straight to it from the parlour, after giving up the keys, for I was tired out with the hard day's work; and just as I was putting out the rushlight, he came in and took it out of my hand, and brought it with him inside, and he closed the door after him.'

If this testimony of the lad were truthful and accurate, Maurice Power, if able to walk home at any moderate rate, would have reached the Glen Farm and his own cottage about midnight, and have become the witness of a crime at the perpetration of which it was impossible, according to Clover's testimony, for Spelassy to have been present.

As Clover was leaving the chair, the Chief-justice said: 'Stop for a minute. There are one or two questions which, for certain reasons, I consider very material, and which were not asked you at either side. Be very careful how you answer them. Tell me, when the prisoner went out, as you have sworn, to Gleeson's to get the horse shod, was he alone, or did you see any one joining him?'

'He was in his own company only.'

'You said you did not actually see the prisoner coming into the house on his way back from Gleeson's; but did you notice any person near the house at the time?'

'Not a soul was with him or near him.'

'Did you know a young man of the name of John Dwyer?'

'Why, but little indeed, my lord,' answered Clover. 'It was but a little sketch I ever got of him.'

'Did you see Dwyer any part of that day, or of the two previous ones, at your master's, or near the house?'

'If Dwyer was speaking to Spelassy—and I cannot call to mind that he was—it was only as he would speak to any other stranger who might bid him the time of day. But when I heard tell of the murder, I remembered that this same Dwyer, two days or so before it, was at my master's house, and treated two strangers who were in his company (and who looked like foreign sailors) to some spirits; and after they drank it, all three went away; but I made no remark what road they took when they left. More-betoken one of the sailors had a deep cut on his face, and had a bad look indeed.'

Although the counsel for the accused was not permitted the privilege of making a speech to the jury, he could not be prevented from directing a very significant and indeed triumphant look in their direction, which, if it could be interpreted into language, would have said: 'See here; the

hand of Providence is visible; and one or two answers to casual questions put by the court, demonstrate that it must have been these two strangers who were associated with Dwyer in the commission of the murder; and the counsel for the crown are following up a false track against an innocent man.'

The judge had evidently been much struck by the demeanour and frank, instant replies of the attendant at the inn, and paused to make a special memorandum in his note-book, and then said with an impulsiveness not usual to him: 'Call your next witness;' whereupon Mr Stephen Meagher made himself a way through the crowd and ascended the table.

Having been duly sworn, the statement he made in answer to the questions of Mr Supple, was a calm, dispassionate, and collected one; and as it proceeded, Mr Travers, with all his reserve, could not but manifest anxiety and uneasiness, as if he feared that the edifice of guilt which had been built up with such skill and ingenuity was about to totter to its foundations; while Maurice Power, who had edged himself into a seat under counsel, never took his bloodshot eyes from the face of the publican.

What Meagher swore was to the following effect: Brian Spelassy had been in his service for years; and although blunt and rough in his manners, he had always found him faithful and honest. As to the all-important Hallow Eve and its incidents, Meagher deposed that he himself had been away from home during that day, having gone to collect some small balances of money due to him by persons who lived in a secluded mountain district, and to which he had to go on foot; and his object in going on that particular day was to make up the full sum he had previously agreed to lend to Power, the necessity for collecting these balances arising from the witness having paid a large sum shortly before for the purchase of a property in the neighbourhood. He did not come home until between nine and ten o'clock, when he was told by the young man Clover that a person had—

What he was told by that individual it is no fault of the writer that he is wholly unable to communicate to the reader, for Mr Travers at this particular juncture interposed, and appealing to the bench, protested against the witness making any statement as to what another told him, more especially as Clover had not been asked a word in reference to this conversation.

The counsel of the accused, with apparent indignation, questioned whether his learned friend seriously objected, in order to have the truth shut out by a mere formal point of evidence; but the Chief-justice, while yielding to the technical difficulty which had been raised, shewed by his manner that he was not pleased with the course taken; and the jurors were left to wonder why what was told to Meagher at the time should not have been communicated to them as well.

'I shall get out the fact I want, gentlemen, in another way,' was the announcement of Mr Supple. 'When you came back that night, and were speaking to Clover, did you see the man who was examined here, Maurice Power?'

'I did not indeed.'

'Could he have been in the house without your seeing him?'

'He could not, unless he had been one of the good people, the fairies.'

'Did you see the prisoner, and when?'

'I had left him behind me in the morning, and when I returned I met him coming in from the stable, after making up for the night the horse he got shod; and after giving him some orders for the next morning, he left, and soon after I heard the door of the bedroom which opens into his closing, for it is one that creaks loudly every time it shuts or opens.'

Mr Supple having, to his own satisfaction, established his client in occupancy of his bedroom at an hour and at a distance from the Glen Farm which made it practically impossible for him to have been one of the gang, then proceeded to deal with the startling facts connected with the possession of the portion of the love-token by Spelassy—that token which, it could not be controverted, was about the neck of the young wife when the assassins entered the cottage.

'Do you know,' proceeded Mr Supple, 'or can you account how that broken dollar came into the possession of the man in the dock?'

'I can,' replied the usurer, with the utmost deliberation. 'It was myself who gave it to him.'

'There was an involuntary expression of surprise at this avowal, and a dead silence; while the judge took off his spectacles, wiped them deliberately, and having replaced them, directed his keenest glances at the witness, who remained quite unmoved, and as if unable to see why such a simple and unequivocal answer should have elicited such an amount of interest.

'And pray, what was the occasion upon which you gave him the token, and how did it come into your own possession?'

'My business often brings me acquainted with strangers and seamen who come from foreign parts, and when I go to Waterford, as I often do, I go on board these vessels from abroad, and exchange guineas and bank-notes for their doubloons and dollars.'

'At a considerable profit to yourself, no doubt?'

rather irregularly interrupted Mr Travers.

'Certainly. I don't pretend to be better than my neighbours, and like others, I sell my abilities and my time to the best advantage; but I give what many who have much talk do not, and that is, money's worth. It was about two or three months after I had heard of the terrible business in the Glen, when a Spanish sailor—and who, by the way, had an ugly scar across his face—met me on the quay of Waterford, near Reginald's Tower, and asked me could I shew him a place where he might get change of some foreign money. I told him it was a part of my business to do so; and from him I got a number of doubloons and dollars. This broken coin that I hear called a love-token was among them, and he was putting it back into his purse, when, as is the custom among us country-people, I asked it from him as a kind of luck-penny; and he gave it to me at once, smiling, and saying at the same time that though it cost some one very dear, it was of no value to him. Soon after this transaction, I was sending Spelassy to the fair of Cashel to buy three head of cattle, and being suddenly called away by a customer, I had not time to count the gold I was giving him (nor did this trouble me at all, as I always found him so honest in all his dealings), and when he came

back from the fair, he said I had handed him this particular bit of money, which, of course, he did not try to pass. I then said to him that I got it myself for nothing, and he might keep it for what I gave for it. That is exactly how he came by it.'

'Could you,' asked the counsel, 'know the sailor you have spoken of, if you saw him again?'

'Most certainly, for, in addition to the remarkable cut along his face, he had a very bad countenance, and I was the more particular in taking notice of him, because he told me that although his father was a Spaniard, some of his mother's people were from the county Tipperary, and that I need not be surprised if some fine day or other I saw him in Clonmel, on his way through to visit them before he went on one of his long voyages.'

'And after the prisoner Spelassy was arrested, and with all you knew upon the subject, did you think it your duty to try and find out this stranger?'

'Indeed I did, sir; I went to Waterford intent on that same design; but the custom-house officers there told me that the *Bella Vista*--for that, he said, was the ship he belonged to--had sailed for South America two days before I arrived.'

It now became Mr Travers' province to cross-examine this important witness; but although he pressed his questions with the skill and dexterity of a mind trained to defeat fraud and perjury under their most specious disguises, he failed to elicit any contradictions. At times he asked about collateral matters of little or no moment, in order to put the other off his guard, and then rapidly turned round to the real point in issue, sometimes pretending to assume that an expression was used or a fact asserted contrary to the actual deposition of Meagher; but the latter always corrected the supposed misapprehension. Baffled, but yet not at all satisfied that there was not falsehood in the plausible, consistent, and apparently frank testimony of the usurer, Mr Travers suddenly asked, after having paused to reflect for a considerable time: 'You no doubt, from your habit of money-lending, are a person of business habits, and make an entry of all your transactions?'

'Not always,' was the reply; 'but I did make an entry of this particular matter, because it was out of my course; and you can have it, and look at it, if you feel any curiosity upon the point; and as he spoke he pulled out from his breast coat-pocket a slip of paper, and handed it to his interrogator.'

'Is this the original memorandum, or did you copy it from some entry in a book?'

'I copied it out,' was the answer, 'for convenience' sake, from the book at home, for I thought it would answer just as well as a help to my memory; and besides, I did not want to have everybody in court looking into my own book, and finding out all about my own affairs. Some of the "quality" are in my debt also, and I would not on any account have their names mentioned.'

The prosecuting counsel here requested of the Chief-justice to allow the progress of the trial to be postponed for a short period until the original book referred to should be produced; at which suggestion there was quite a forensic scene, Mr Supple protesting against what he characterised as only leading to wanton and vexatious delay, and artfully seeking to enlist the favour of the jury by vehemently protesting that as to his own

time the loss of it was not worth speaking of, but he felt that theirs was valuable indeed, and that they were kept away from their respective occupations at great personal inconvenience. But Mr Travers was firm; and the judge granted the application, as the residence of Stephen Meagher was in the town, and but a short distance from the court-house.

The witness was proceeding in a sulky mood, as if greatly offended at any doubt being cast upon his statement, to leave court in search of the book which he was required to produce; but his frown deepened into a sterner contraction when informed that one of the police-officers in attendance should go with him and take possession of it. About an hour then elapsed, and the Chief-justice had resumed his seat on the bench, and the twelve liegemen their several places in the uncomfortable pen that builders appear delighted in constructing for the torture of their unoffending brethren, when Stephen Meagher was seated anew in the witness-chair, looking, however, less cool and collected than on his original appearance. Taking from the constable who had accompanied him a heavy old outside coat, displaying pockets of unusual amplitude, he drew forth from one of these depositories an account-book and opened its pages.

'Shew me in that book,' said Mr Travers, 'the original entry corresponding with the slip of paper which you handed to me as a correct transcript of it, made for this trial.'

The usurer turned over page after page; the stillness in the court during this process being such that even the rustling of the leaves was nervously exciting to the audience.

'Is the entry there, sir?' asked the judge with considerable asperity of tone, after several minutes had elapsed.

'I cannot find it now, my lord,' was the reply; 'but the pages of the book are not numbered; and since I made the copy, shewing the exact day and date when I got the love-token from the Spanish sailor, some of the leaves may have fallen out, or become torn by accident.'

'Is that the only explanation you can give?' said Mr Travers, his voice rising to an indignant pitch.

'It is mighty odd, no doubt,' muttered Meagher. 'And one might think the "good people" had something to say to this.'

'I very much doubt about the good people having anything to say in the affair,' was the rather sorry attempt at sarcasm of his interrogator.

During the time that this little scene was being enacted, Maurice Power appeared as if under the influence of a spell. He looked at the witness with intense and absorbing interest, and frequently his eyes would wander down even to the outside coat of Meagher, out of one of the pockets of which the account-book had been taken, the coat lying on the table close to where the counsel were placed; and as if unconscious of what he was doing, the excited man drew the garment to where he was standing, and was minutely inspecting it in order possibly to find in it the missing leaf in the account-book. The action was not observed; and he hastily pushed back the old coat to its previous position, and then trembling with emotion, whispered a few words into the ear of Mr Travers, whose usually calm features became overspread with a deep flush. This unusual and irregular interruption did not pass unnoticed; and Mr

Supple, addressing the judge, expressed his hope that the ordinary and regular course of procedure would be adopted in that court of justice, and no one presume to busy himself by offering suggestions to those who were prosecuting on the part of the crown. 'That man,' he added, pointing to the bereaved farmer, 'has already been guilty of gross impropriety by using an insulting exclamation when that decent lad Clover was giving his testimony.'

Pushing back into a seat behind him the object of this censure, Mr Travers proceeded to continue the cross-examination of the usurer, the tendency of which was to lead to the inference that the statement as to any entry of the transaction with the Spanish sailor being recorded in his account-book was a fiction, and invented deliberately for no good purpose, in order to mislead the jury. The man was tied to the legal stake, and no ingenuity seemed capable of releasing him from the false position in which he had placed himself, whether arising from some inscrutable and deliberate intention to mislead, or only from a rash statement innocently made, and wrongfully persisted in, from a false shame.

'Where do you usually keep that account-book, Mr Meagher? I presume you have it carefully locked up, and not, as we saw occur to-day, left in the pocket of that outside coat of yours, where curious or dishonest people might get access to it?'

'Why, then, you are wrong, sir,' was the reply of the party interrogated, 'for the book was often left in that old coat of mine, where it hung up near the bar, and people frequenting the house might, if they wished, have gone into the bar and meddled with the book.'

'A very incredible story indeed. And may I ask, did you recently purchase that coat, the depository for your valuable entries and documents; or, judging from its appearance, is it an old acquaintance of yours?'

'I have had it a long time, but never wore it of late times, as Clover can tell.'

'I think, Mr Travers, with every respect for you,' observed the judge very blandly, but evidently displeased, either with the ostensible levity, or rather the irrelevancy of the question, 'that you are pursuing the inquiry as to this particular article of dress very far indeed; for whether the man had it for a long time or not, he tries (satisfactorily or the reverse is another question) to explain his inability to produce the alleged original entry in the account-book by insinuating that some of the customers at the inn may have had access to the pockets of this coat, and removed some pages; but it will be for the jury to say what possible object any person could have had in so doing, unless, indeed, he himself figured as a debtor in the pages of the book.'

'I agree fully with what your lordship has thrown out for my guidance, and I shall only ask two questions more upon this subject.—Did you ever, Mr Meagher, miss the coat itself from your house?'

'Never.'

'Was it your habit to place the account-book here?' inquired Mr Travers, pointing to the inside of the left breast, in which there was inserted a pocket of unusual dimensions, and the opening of which was secured by two black thongs of leather firmly fastening on very large buttons; so that once deposited there, no document could be abstracted

without considerable trouble, and certainly could not fall out from any mere accident.

'It would fit nowhere else; and when I used to go from home to collect my accounts, or let the people know how they stood with me, I always had it in this identical coat; but latterly, as the country was so much disturbed, I got afraid to go for my money to my debtors, and usually made them come to my place to settle.'

'Had you the coat before you heard of the murder of Ellen Power?' asked Mr Travers, with an earnestness which the question did not seem to warrant.

'No doubt of it I tell you; none, none,' was the sullen reply.

'Then, look here!' exclaimed Mr Travers, in accents startling from their abruptness and sternness of intonation, fixing his eyes on the usurer, taking at the same time a small piece of jagged cloth, with a button of a peculiar shape attached to it, from the trembling hands of Maurice Power, and then holding up the breast of the coat, where there was a portion which had been dragged and torn away, and in the vacant rent a corresponding button wanting. 'Was not this the very dress you wore when you and your associates broke into the house of this poor fellow here in the Glen on the Hallow-Eve night, and busely slew, for greed, his wife and child?'

The individual addressed in this unusual and extraordinary manner turned deadly pale, his jaw became rigid, the hands worked convulsively, drops of agony suffused his face, and his gaze remained riveted on the garment thus held up by his interrogator, while he could only exclaim: 'What a fool I have been!'

'He is one of them; he shall not escape!' shouted the almost frenzied farmer, springing on the table before any one could interpose, and seizing the object of his accusation by the collar. 'Sure I tore this very bit of cloth from him the very night when struggling with him on the floor; and after I came to my senses in the early morning it was in my closed fingers; nor have I ever parted from it since. No wonder the villain shakes and trembles and is afraid, for it is a judgment has come upon him at last!'

LIFE IN THE EAST.

PERHAPS the most striking characteristic which the changeless East presents to us, the restless ever-changing denizens of a busier clime, is its immutability. Thousands of years have elapsed since the herdsmen of Abraham drove forth his flocks to pasture beside the oaks of Mamre; but the Arab sheik still sits, as he sat then, in the doorway of his tent; and the Arab princess behind the camel-hair partition still kneads cakes on the hearth for the passing guest, as Sarah did of old for the wandering messengers of Heaven. It is as if Time had drawn a silent curtain of repose around the ancient cradle of our race, that we might see reproduced there, as in a mirror, the manners, the customs, the very salutations even, which were the fashion thousands of years ago when the world was young.

With wondering eyes, we stand to-day in the streets of Damascus or Bagdad, and see around

us the familiar scenery of the *Arabian Nights*. Through yonder crowd the one-eyed hunchback threads his way; there beside you, a shapeless mass of yellow drapery, glides Fatmé the beautiful, on her way to the bazaar, enveloped in the envious veil, which hides from the curious gaze of the Infidel all except the flash of a pair of lustrous gazelle-like eyes. Behind you, in the gate, sits a venerable old man, who with his flowing white beard and dreamy eyes, sagaciously meditating upon nothing, might be, but is not, the far-famed Haroun Alraschid in one of his many disguises. Around you as you gaze is all that makes the past dear to the antiquary, the scholar, and the saint; and it is this curious sameness amid the universal change of almost the whole world besides, which makes the study of existing manners and customs in the East at once so interesting and so instructive.

To throw light upon biblical life and manners, by tracing a picture of Bible lands as they are to-day, is the task which Dr Van Lennep proposes to himself, and accomplishes in a very thorough and exhaustive manner.*

These lands, the nursery of our race, occupy an isolated and yet central position—central, that the light of a nascent civilisation might diverge from them as from a focus; and isolated, that no rude convulsions might destroy in infancy the germs of science and the arts. Before the dawn of history, on the wooded banks of the Euphrates, or on the wide plains of Mesopotamia, many an unknown Chaldee Herschel studied the stars undisturbed. In the docks of Tyre and Sidon, many a Phœnician Napier toiled in security and peace to frame the merchant navy of these ancient Queens of the Sea; and their discoveries, their wild often unfructuous guesses after truth, were not made in vain; they exercised a restraining and modifying influence upon the ruder races around them.

In all this region, so rich and beautiful in ancient times, so comparatively sterile now, water, Dr Van Lennep tells us, is, as it always has been, scarce. A good spring is so valuable that it often determines the site of a town or city; trees are planted round it; it is surrounded with mason-work more or less costly; and here at least once a day the women of the village come to draw water. The work is hard, but it is perhaps the most pleasant of all their duties; for while their earthenware jars are slowly filling at the spring, they enjoy the luxury of a social chat, and give and receive all the gossip of the neighbourhood. 'Life on the waters;' the boats, the ships, the skiffs that glide swallow-like along the currents, are all made after models which the curious may find on the sculptured slabs of Nineveh or on the ancient monuments of Egypt, and that in spite of the fire-ships of the Infidel—noisy monsters!—which are now to be seen puffing and steaming away in all parts of the Mediterranean.

* *Bible Lands, their Modern Customs and Manners, illustrative of Scripture.* By Henry J. Van Lennep, D.D. 2 vols. (Murray.)

Irrigation, although comparatively neglected, is still much used for the cultivation of gardens, and the water is raised by means of water-wheels, such as were used in the days of King Nebuchadnezzar's glory to raise water for the hanging gardens of Babylon. In these gardens, vegetables, such as beans, turnips, beet, radishes, the egg-plant, and the tomato, are cultivated; and the olive and the vine are now, as in ancient times, universal: no garden is without one or two plants of the latter, which is often trained to shade with its beautiful broad leaves the flat roofs of the houses. Flower-gardens such as we have are unknown; although some flowers, such as the rose, the hyacinth, the carnation, and the tulip, are universal favourites, and are in their season either worn on the forehead, fastened under the edge of the turban, or carried in the hand. On the first of May the Christians hang over the doors of their houses garlands of roses, which remain undisturbed until the following year.

Cattle are as abundant now as in the days of the patriarchs; but they are of small size, and are seldom killed, not from any gastronomical dislike to beef, but because the animal is considered too valuable to be used for food. In the greater part of Asia Minor, however, it is the custom, as it was once in Scotland, for each family to kill in autumn a cow or young bullock, the flesh of which salted, dried, and variously seasoned, forms the frugal provision of meat for the winter months. Mutton is much more extensively used than beef as an article of diet, and is almost invariably very good. The milk of the sheep, which is much richer than that of the goat, is also much used for food. Prior to the introduction of European cottons, almost the entire clothing of the people was made of silk or wool; and among some of the wandering tribes, every girl must weave with her own hands a praying carpet, into the centre of which she works some of her own hair. She then sends it as a present to her betrothed, who has never seen her, and who thus learns in this romantic way the colour of her hair.

All the other animals, wild or tame, which are alluded to in the Scriptures may still be found, Dr Van Lennep tells us, in these Bible lands. The shepherd when he leads out his flock to the pasture must still do battle as David did with the lion and the bear and the ravenous wolf, which last sometimes in winter becomes so horribly tame, from lack of food, that it steals into the large towns and disputes with the dogs the refuse and offal of the streets. Dr Van Lennep gives a well-authenticated story of one which burst into a room where a family were sitting at supper, and amid the shrieks and consternation of the assembled guests, strove to snatch away a portion of food from the table. The dogs themselves, houseless and homeless, apportion out the large towns into districts, each of which belongs to a separate pack; and these curs become so fierce and bold, that a drunken stranger reeling home at night has been known to be overpowered and devoured by them, little more being left of him in the morning than the few ghastly relics which remained of the

celebrated Jezebel, after the dogs of Samaria had finished their horrible feast in the field of Naboth.

Serpents, scorpions, and lizards still abound; and still as of old, the peasant rejoicing over the green beauty of his budding fields, has his hopes blasted in an hour by the appearance on the horizon of a swarm of advancing locusts. These destructive insects when seen at a distance have very much the appearance of a cloud of dust, which constantly advancing, finds before it an Eden, and leaves behind it a desert. Formerly, Dr Van Lennep tells us, no attempt was made by the Mohammedan fatalists to avert or mitigate this plague. It was *kismet* (Fate), and no more could be said about it; but of late more enlightened ideas have crept in from Europe, and now efforts are being made to destroy the eggs of this insect; which have a marked effect in diminishing its inroads.

The home-life of the people of the East, their joys, their sorrows, and their domestic habits are next portrayed; and Dr Van Lennep points out in how many respects they agree, and in what few points they differ from the habits of the people in Bible times. The ethnology of all these regions has necessarily somewhat changed, yet the different races occupying the country in ancient times can still be traced easily enough in their descendants. As many as half-a-dozen different races may sometimes be found occupying the same town or village, and yet they do not mingle. Like streams from different fountains, the current of their separate lives flows on side by side but apart. First, there are the Jews, changed, not improbably deteriorated in personal appearance since the days of David, but still so distinct, so apart from all others, that their nationality clings to them as it has clung to them for more than eighteen hundred years of persecution and exile. Almost as easily identified are the Syrian race, the Chaldee Christians, and the Egyptians, who have amalgamated themselves with their Arab invaders, but still retain something of that ancient type, which, with a beauty of its own, intrals us as we gaze upon the face of the mysterious Sphinx. The different populations which made up the kingdom of Persia, the Armenians, the Koords, the wandering tribes of the desert, have all their representatives still.

Of the languages spoken by all these different races, Hebrew, as most people are aware, is now a dead tongue, but is represented by two modern dialects, the Maltese and the modern Syriac. Arabic is also very much akin to it. This language has an extensive range of harmonious sounds; the vowels are clear and full; and it is so rich and copious, that Dr Van Lennep gives an instance of an old woman who supplied a learned poet and historian of Mecca with thirty-nine different Arabic names for the onion. It is written from the right to the left, as all the dialects of Western Asia are, except the Armenian. The Persians and Turks use the Arabic character, which, like the Hebrew, has the troublesome peculiarity that it cannot be written with a quill or steel pen, but must be traced with a small pointed reed, the ink used being a thick solution of gum, lampblack, and water.

The art of printing was, until a few years ago, quite unknown in the East, and is still very little appreciated except by the Christian populations.

The people are divided into two classes—those who lead a wandering life, and those who dwell in permanent houses. The tents of the former are divided into two apartments, one for the men, and one for the women. The furniture of the tent is simple; it consists of cushions and camel packs, with a few ordinary utensils, such as pots, kettles, frying-pans, and wooden pails. In the centre of the apartment a fire of camels' dung is constantly smouldering, with a coffee-pot simmering upon it. Guests are received in the men's apartment only; but on the other side of the curtain, so near that they can hear every word that is said, are the women, engaged in the preparation of sweet curds, cheese, bread, confections, and a peculiar preparation of sour camels' milk called *leben*, which from the earliest ages has been a very favourite article of food in the East.

The dress of these wanderers of the desert is simple, consisting only of an ample cotton shirt, open to the waist, the bosom of which serves as a capacious pocket; a leathern belt secures it round the waist; and over the shoulders is thrown a striped woollen cloak; while a gay handkerchief bound round the head with a cord of camels' hair forms the turban, and completes the costume.

The first idea of the permanent house seems in the East to have been taken from the tent. Most of the houses in an oriental town consist only of one story, and follow in all their internal arrangements the simple plan of the tent, being divided like it into two apartments—one for the men, and one for the women. Even when a man is rich enough to afford in his mansion many more rooms than these two, his imagination still runs in the groove of the tent, and he fashions for himself what the Arabs call a *dowar* in stone; that is, a cluster of low rooms built side by side, inclosing an oblong court, which is often very beautiful; a cool shady place with a pavement of tessellated marble; a fountain playing in the centre; rows of citron, lemon, and orange trees, and an abundance of flowering shrubs.

The principal room in the house is that where the guests, men alone, are received; it generally fronts the door of entrance, and is furnished with a raised divan and cushions. A rich man has usually two houses built side by side, one for himself, and one for the women of his household; the house of the women being generally the finer of the two. These houses are often lavishly adorned inside with carved marble and alabaster, and have elaborate ceilings of curiously wrought wood, beautifully designed and gorgeously coloured. The roofs of all the houses, whether the owner be rich or poor, are invariably flat, and during the summer months form the usual bedroom of the family.

The furniture of all oriental houses is simple compared with ours: the household goods of the poor consist only of a few bowls and wooden spoons, a saucepan or two, and a coarse carpet, all which Dr Van Lennep tells us are kept scrupulously clean. The rich have no such variety of furniture as is common in Europe, for chairs, though not unknown, are disliked, the people, both men and women, preferring to sit with their legs gathered up under them on the divan—a broad couch which runs round three sides of the room. It is in the richness and ornament bestowed upon the cushions of this couch and in the carving of

the doors, ceilings, and pillars of his house, that the luxury of an oriental Rothschild finds vent.

Charcoal is used for cooking purposes, and as a rule the Orientals like their dishes very much cooked. They are particularly fond of hashes and stews, composed of a great variety of vegetables and fruits, highly spiced, and flavoured with meat cut into small pieces. They use oil largely in their cookery, and do not confine themselves to garden vegetables, but gather, besides, a great variety of wild plants and edible gourds. They make still, Dr Van Leunep tells us, a very savoury soup of lentils flavoured with onions; the veritable mess of red pottage which cost the eldest son of Jacob his birthright and his father's blessing. Of pastry they are extremely fond; and the women still, as in the days when Bedreddin sold bread in the streets of Bagdad, pride themselves, as the wife of the grand vizier did, upon their skill in compounding cream-tarts, sweet cakes, and confections of every kind. The food when cooked is placed upon a small table about two feet high, round which a certain number of guests sit, so many to each table; they invariably eat with the hand, wooden spoons only being used when soup, rice, or leben form part of the entertainment. The Orientals have only two meals in the day; one early in the morning before the duties of the day begin, and the other about sunset when they are finished. At noon, however, they supplement this somewhat moderate allowance of food by a light meal composed of dried fruits, cheese, and bread *ad libitum*.

Whenever it is dark the poor retire to rest; but the rich are fond of artificial light, and often keep a candle burning all night.

No oriental house is complete without a bath, which is of the kind known to us as the Turkish bath. Besides these private baths, public ones are common, to which all the women go at least once a week. They set out for the bath early in the morning, taking with them their children and slaves and an abundant supply of provisions. There they meet with their friends and acquaintances, and spend the whole day in chat and gossip, in dressing, in dyeing their palms, finger-tips, and feet with henna, and in plaiting their long hair into numerous fine braids. With these braids silk is intermingled, upon which gold coins are strung, and they (the braids) may be of any number from nine to twenty-five. Sometimes the hair is very long, reaching below the knee, and forming a glittering fleece, the gold coins intermingled with it flashing and glancing with every movement of the wearer. Across the forehead it is clipped straight, within an inch of the eyebrows, leaving two longer locks hanging on either side of the face, by which the women swear, as the men do by their beards. On their heads they wear as a substitute for the turban a small red cap with a blue tassel, round which a light muslin handkerchief of tasteful and becoming colours is bound, and gracefully tied in a knot at one side. Bands of gold coins or of small gold plates linked together are often worn across the forehead; and in Lebanon, a monstrous ornament shaped like a horn or hollow tube of silver is worn upon the top of the forehead, secured in its place with cushions, and a strong strap which passes under the chin. It is an ornament reserved exclusively for matrons, and once assumed is never laid aside; the hapless victim of fashion wears it

even at night, a hole being made in the wall beside her bed, for the purpose of accommodating this most uncomfortable appendage.

From the constant use of the veil, the bath, and open-air life, the oriental women have often very clear beautiful complexions, and fine eyes, whose apparent size they increase by the use of kohl, a preparation of antimony, which they apply with an instrument of wood or silver to the edge of the eyelids. As a class, the women of the East are very industrious and economical; and even in households where there are several slaves, the wives and daughters generally wait upon their husbands and fathers.

From the almost complete separation of the sexes, it naturally follows that love is not recognised as the basis of marriage, which is to a great degree a matter of pecuniary arrangement, and is managed by the mother, aunts, or sisters of the bridegroom. These select for him a suitable wife, and settle the preliminary points, especially the all-important one of dowry, which is in reality the price paid for the wife. The marriage ceremonies then follow, differing according to the nationality of the contracting parties. In all, however, the bride is arrayed in her richest apparel, and covered from head to foot with a veil, generally of bright scarlet silk or crape, upon raising which the bridegroom beholds her face for the first time! 'This is an anxious moment, for upon it depends the happiness or misery of a lifetime; happy is she if, like Isaac with Rebekah, it can be said, 'he loved her,' for not unfrequently her lot is that of the hated Leah, and life is made up of many slights and much suffering and a vain struggle with many rivals. Polygamy is common among the Mohammedans, and so is divorce for the most trivial causes; and the Muslims of the Shiite sect have a strange habit of contracting marriage for a limited period, varying from a few days to ninety-nine years! All over the East the birth of a son is hailed with intense delight, and the mother of many sons still feels all the exultation of Jacob's unloved wife, when she exclaimed at the birth of her sixth son: 'God hath endued me with a good dowry.' At present, as in ancient times, a babe is wrapped in a long bandage of swaddling-cloth, so tightly that it can move neither hand nor foot. In this comfortless condition it lies day and night in its cradle, its cries being stilled by constant rocking. When beyond the domain of the cradle, anklets with bells attached are fastened round its tiny limbs, and toys are given to it to play with, not unlike those our own children use. When a little older, the child goes to school with the little boys and girls of the neighbourhood, who all squat on the floor and study aloud, he who makes the most noise being accounted the best scholar.

The Orientals are fond of society, and the more wealthy delight in giving great entertainments, at which a fatted calf or two or several sheep roasted whole, crown the board. The guests sit round the tables, and each does his own carving, tearing off such portions as he fancies from the centre dish with his hands. After their own fashion the Orientals are fond of music, and the art of the improvisatore is held in great esteem among them; but their melodies sound to us as rude and inharmonious as our classical music is unpalatable to them.

The systems of government and of religion, and the state of commerce and the mechanical arts, in the East, are all now, Dr Van Lennep tells us, in the process of being every year more and more influenced by the enlightenment and civilisation of Europe; and in this lies the best hope for these wasted but beautiful lands, around whose desolation the traditions of the past still linger, investing them with a melancholy and imperishable charm.

AMUSEMENTS AT SEA.

THROWN on their own resources, and finding themselves the denizens of a little world of wood and iron, tossing on a measureless waste of briny waters, the passengers on board a ship seldom fail to club their wits for the common good. Of course, when social pastimes are in question, a great deal depends upon the weather and the latitude, as also the size and style of the vessel. But one condition is essential, and that is a long voyage. The swift-steaming New York packets are in too violent a hurry to pass Cape Race or enter the Mersey, for more than a cursory intercourse between the human units who jostle one another at meals in the grand saloon. The most agreeable of the floating hotels that ever put to sea were certainly the old-fashioned first-class Indiamen, the original teak-built 'tea-wagons' that in leisurely fashion conveyed our fathers and grandfathers to and from Calcutta and Bombay. Well provided and well officered, with an excellent table and ample elbow-room, these fine slow ships gave those on board valuable consideration for their passage-money. Nothing could be more pleasant than the dances, the music, the amateur theatricals that went on beneath the broad bright light of the tropic moon, while in the cabins below quieter spirits found solace in endless games of whist, chess, or backgammon.

The passengers on board an Indiaman had every inducement to see the best side of those with whom they were thrown into contact, since all were committed to a voyage which might last for five months, and the monotony of which was only relieved by a call at St Helena and a brief scamper at the Cape. The same in a less degree may be said of the temporary residents on board those huge clippers that plough the vast mileage of ocean between our shores and those of Australia. Once well away from head-winds and chopping seas, to lounge beneath the deck-awning of one of these well-ordered packets, listening to the strains of a capital band, or to waltz on planks as steady as those of a ball-room, is to reduce the privations of sea-travel to a minimum.

Perhaps the most distinctly maritime amusements are to be looked for on board vessels of a moderate tonnage, bound on a voyage of sufficient length to make the unemployed hours hang heavily on a passenger's hands. Then is the time when fire-arms are at a premium, and murderous volleys are discharged, now at the pretty Cape pigeons that flutter, ignorant of the wanton hostility of mankind, about the rigging; now at some albatross, soaring on tireless wing; or perhaps a long shot at the penguins, that sit motion-

less on the weed-draped reef of rocks that borders some uninhabited island.

A less cruel test for the accuracy of the marksman's aim was often afforded, especially in vessels of the royal navy, before the use of rifled firearms grew habitual, by the simple expedient of shooting at an empty bottle dangling from the yard-arm. It was astonishing, in the days of smooth-bored and spherical bullets, to note the profusion of misses in proportion to the paucity of hits; and it was creditable to the marines in particular, that with so indifferent a weapon as brown-bess they should have made as good practice as they piqued themselves on doing.

But shooting, which implies the presence of something to be shot at, is obviously a pastime less well adapted to nautical sportsmen than is the gentle piscatorial art. Theoretically, the ocean may be compared to a titanic fishpond, a huge watery wheel-of-fortune, whence might be drawn prizes of any dimensions from the kraken to the sardine. In actual fact, the best sea-fishing is always near the mouths of those mighty rivers which, in Africa and America, daily sweep down tons of alluvial soil, rich in organic matter, to dye the green waves chocolate colour. The enormous beds of weed, such as those of the Sargasso or so-called Sea of Grass, the dread of early Spanish navigators, are the haunts of innumerable fish, brilliant with every hue of the rainbow, and flashing like a shower of living opals amid the green tangles of the densely matted vegetation that supplies them with a home and a maintenance.

The spearing, or technically 'striking,' of dolphins, porpoises, and so forth, with a barbed trident or a small harpoon, is of course an amusement in which sailors only can take an active part; but all can participate in the strategy that is to lure to his ruin the common enemy, the greedy tenacious shark, that has perhaps followed in the ship's wake for several days, ever stealthily on the watch for the accident that may put man or beast into his power. It is almost necessary to have been becalmed in the tropics to appreciate the sort of personal animosity which crew and passengers learn to feel towards the great fish that lies beneath the ship's counter, looking up with hungry eyes—his horrid shape discernible through the slight ripple caused by the waving of his lofty back-fin. There is little fear of his fighting shy of the bait. A shark will sometimes almost leap out of the water to seize the concealed hook that is descending to him; and one has been known to take the same hook twice, although his mouth and cheek were bleeding profusely from the first ineffectual seizure of the barb. The wide jaws close upon the tempting bit of pork, and then comes the hauling in of the line and the triumph over the trapped monster; no unresisting prey, however, for he fights fiercely even on deck, snapping and dealing dangerous blows with his broad tail, until disabled and despatched with axe and handspike.

Izaak Walton would have been amazed to see the rough-and-ready fashion in which his favourite pastime is practised at sea; in the Gulf Stream, for instance, where the warm current of water harbours fish of brighter colours and greater delicacy of flavour than those of colder oceanic tracts. Here are no niceties of rod and line, and

flies artfully tied to counterfeit genuine insects, or silvery minnows spinning to cajole the spotted trout. Anything that is long and strong does duty for a line; anything, from a morsel of salt junk or a paring of bacon to a shred of scarlet cloth or a scrap of shining metal, makes a bait. The great essential is that there should be a hook at the end of the cord, and that the latter should be tough enough to drag the struggling captive from his native element. But the line must be in cool, steady hands, and there must be no hurry or impatience in getting the prize out of the water; for sea-fish are terribly strong and active, and do their very best to resist their intended transfer from the water to the planks of the poop. Loud are the exclamations of admiring wonder, as rays and bonitos, flying-fish and parrot-fish, king-fish and Jew-fish, begin to be piled in successive heaps, littering the deck with their blue and green and silver and amber and vermilion; and vociferous the applause as a mighty sun-fish, the central trophy of all, is hauled flapping over the taffrail.

A few hints on fishing from a ship at sea may be welcome to some of our readers. The best sport is trolling astern for albacore in the Pacific, and its near relation the bonito in the Atlantic. Both these fishes destroy millions of the unfortunate little flying-fish; and in nine cases out of ten, its long fluttering leaps through the air are not made in sportive pastime, but are desperate struggles to get away from the wide open jaws of one of its larger brethren of the deep. To lure the albacore from its watery haunts, all that is needed is to make a bait which shall roughly resemble a flying-fish; and the resemblance may be a *very rough* one, for, as we have said, sea-fish are not particular. For many kinds of large fish a teaspoon makes a very good bait. It is fitted for the purpose by cutting off the handle, and boring two holes in the bowl, one at each end. To each hole a few inches of gut, served with wire, are fastened, and one of these lengths of gut is attached by a swivel to the fishing-line, while one or two hooks are mounted on the other. Towed after a ship or boat, this bait looks like a small fish swimming near the surface, for the spoon keeps twirling, the swivel preventing the line from twisting with it, and a fish soon makes a dash at the bright glancing metal. In fishing for albacore, remember that very little will be done in a calm, when the fish generally keep away from the ship; and the same may be said of any attempts at fishing when the ship is going at a high rate of speed. A moderate speed is best for sport of all kinds. To make a good bait, take a piece of hard wood—teak, oak, or ash—four or five inches long; cut it roughly into the shape of a rather slender fish without the tail; make a notch at both ends, and connect these by two longitudinal grooves cut on opposite sides; then lay a piece of strong wire in the grooves, making a loop in the notch at each end. Get some bristles out of a brush, and fix a bunch of them, about three inches long, in a hole on either side an inch from the head. These will represent the wings: a few more shorter ones may be fastened on at the other end, so as to look something like the tail; but the bait will do just as well without it. Then the whole must be sheathed with a narrow strip of thin sheet-tin or bright sheet-lead wound spirally round it from head to tail. Then mount two hooks back to back on a piece of strong gut

five inches long, and to prevent the gut being cut by the fish's teeth, twist round it fine brass or copper wire. (Gut served in this way with wire can be bought of ship-store dealers in seaport towns.) The gut thus armed and protected is attached to the wire loop at the tail-end of your flying-fish. A shorter piece of gut similarly made up, and bearing two more hooks, is fastened to the head loop. Then attach a couple of feet of deep-sea fishing-line to the head loop, taking care that this too is served with wire along the greater part of its length; and then by a swivel, attach it to your fishing-line. Drop it over the stern, paying out a sufficient length of line to keep it well in command, and make it bound occasionally from wave to wave after the ship, and you will not have to wait long for a bite and a hard tug. Then haul in quietly and steadily, and try again with the same bait. It is very easy to make it; but sailors often fish successfully with a much rougher apparatus. They take a hard piece of wood about five or six inches long, and broader at one end than the other. The fishing-line is secured to the narrow end, and a piece of white rag is tied round it, hanging loose to represent the wings. A nail is then driven through the broad end, its sharp projecting point forming the hook; and the rude but deadly bait is completed by twisting strong twine round both nail and wood, to prevent shifting or splitting.

For those who have some knowledge of marine zoology, and above all for those who know how to work with the microscope, there is much solid pleasure in store if they can improvise a towing-net and send it out astern when the ship is sailing before a light wind in the tropics. Readers of the accounts of the *Challenger* expedition will remember that two methods are employed for collecting the smaller inhabitants of the deep. There is the deep-sea dredge, which goes down to the bottom and searches the depths; but this is a formidable affair to manage, and complex tackle and a steam-winch must be used to bring it up. But while the dredge is at work far below, the light towing-net is skimming the surface; and for those who know how to examine a crowd of waifs and strays gathered from the sea, it would be well to make a trial of a small improvised towing-net. A bag of any stout gauzy stuff, with a small hoop to keep its mouth open, will do very well. The stuff of which butter-cloths are made is often used for the purpose in working with a boat; and probably it would do at sea if it were strengthened by a light net being sewn on outside of it. The towing-line is attached by three short lengths of strong cord, which diverge from it to three equidistant points on the hoop at the mouth of the net. Night is perhaps the best time for towing, for it is then that the phosphorescence shows the surface to be teeming with minute life. The net is best used when the ship is at a low rate of speed. The prizes captured can be bottled in spirits; or if mounting apparatus is at hand, many welcome additions may be made to the cabinet of slides for the microscope.

Deck-quoits, deck-bowls, and in later times, deck-croquet, have been introduced at sea on various occasions; while draughts, backgammon, and other games of the same class, have whiled away many a weary hour below. On board some ships a bout of fencing or single-stick among the crew

or petty officers is often watched with an interest keen in proportion to the rarity of external events; and in some vessels where Lascars are employed, very fair juggling, shawl-dances, and sword-dances may sometimes be witnessed. The fun of the oddly named sport known as 'cock-fighting' depends wholly on the grotesque helplessness of the two human combatants, who, deftly pinioned with sticks and handkerchiefs, and seated on the deck like Turks or tailors, try to overthrow one another, while each does his best to preserve his unsteady balance. Bathing, with a sail spread to prevent drowning or danger from sharks, boat-races, and learning to go up the rigging, are diversions now less in vogue than they used to be.

Pet animals, from the monkey to the mongoose, and from the tame lamb to the armadillo, never get so much petting on shore as on the waste of waters. The very roughest of the seamen appear to have a soft touch and a cheery word for these dumb comrades of the voyage. A ship will sometimes have a small crew of monkeys or parrots on board; and indeed sailors will make pets of anything and everything. A naval surgeon once related in the columns of this *Journal* how he had seen a sailor on board a gunboat in the tropics make a pet of a huge cockroach. Jack has not always leisure for amusements properly so called, but there are times when the ship howls along under steady canvas before the friendly monsoon or trade-winds, and when a considerate captain knows that he can allow the bulk of his crew to enjoy the halcyon interval of repose as best they may. There is often a black cook or some negro sailor who can play the fiddle, and has a turn for buffo acting and comic vocalism, and who is on such occasions the life and soul of the fore-castle, for sailors are as easy to amuse as so many school-boys.

One objectionable maritime recreation is happily a thing of the past, at least in well-commanded vessels. The saturnalia that formerly took place on crossing the Line may have originally had some humour in them, but the fiction that the ship had been boarded by Neptune and Amphitrite, who came to greet novices who had never yet been on the southern side of the equator, soon degenerated into a mere pretext for extortion from those who could afford to pay, and ruffianly ill-usage of those who could not. It is evident that the rough practical jokes, the lathering, the tarring, the ducking and drenching, which were thought fair on these occasions, might readily be turned into an excuse for brutal treatment of an unpopular victim; and the black-mail levied on the more well-to-do voyagers had a demoralising effect on the crew. A better device was that which the commanders of ships of exploration, on their arctic and antarctic cruises, have sometimes sanctioned, namely, the publishing on board of a weekly newspaper, to the contents of which the word 'news' was not indeed strictly applicable, but which detailed and commented upon the petty events occurring in that secluded community, and which gave to officers and men an opportunity of seeing their lucubrations promoted to the dignity of print.

When ships are roomy, much enjoyment is frequently afforded by the acting of charades and light comedies; and where there is a decent amount of histrionic talent in passengers or crew, this kind of entertainment is invariably a success. When the

captain is fortunate enough to rank ladies—especially young ones—amongst his passengers, and a piano is on board, then the voyage is robbed of much of its usual tedium, and a Committee of Entertainment, if judiciously appointed, will vary the monotony of the way by occasional concerts and balls; finishing off with a Benefit for Jack in the fore-castle.

THE THAMES AND WINDSOR FOREST.

(From the poem *Cooper's Hill*.)

SIR JOHN DENHAM, the writer of the lines below, was born at Dublin in the year 1615. Educated at Oxford, then the chief resort of all the poetical and high-spirited cavaliers of the day, he was made governor of Farnham Castle by Charles I.; and after that monarch had been delivered into the hands of the army, his secret correspondence was partly carried on by Denham. *Cooper's Hill*, the poem by which Denham is now best known, was first published in 1642. The descriptions are interspersed with sentimental digressions suggested by the objects around—the Thames, a ruined abbey, Windsor Forest, and the field of Runnymede.

The four lines printed in italics have been praised by every critic from Dryden to the present day.

My eye, descending from the hill, surveys
Where Thames among the wanton valleys strays;
Thames, the most loved of all the Ocean's sons
By his old sire, to his embraces runs,
Hasting to pay his tribute to the sea,
Like mortal life to meet eternity.
Though with those streams he no remembrance hold,
Whose foam is amber and their gravel gold,
His genuine and less guilty wealth to explore,
Search not his bottom, but survey his shore,
O'er which he kindly spreads his spacious wing,
And hatches plenty for th' ensuing spring,
And then destroys it with too fond a stay,
Like mothers which their infants overlay;
Nor with a sudden and impetuous wave,
Like profuse kings, resumes the wealth he gave.
No unexpected inundations spoil
The mower's hopes, nor mock the ploughman's toil,
But Godlike his unwearied bounty flows;
First loves to do, then loves the good he does.
Nor are his blessings to his banks confined,
But free and common, as the sea or wind.
When he to boast or to disperse his stores,
Full of the tributes of his grateful shores,
Visits the world, and in his flying towers
Brings home to us, and makes both Indies ours:
Finds wealth where 'tis, bestows it where it wants,
Cities in deserts, woods in cities plants;
So that to us no thing, no place is strange,
While his fair bosom is the world's exchange.
*O, could I flow like thee, and make thy stream
My great example, as it is my theme!
Though deep, yet clear; though gentle, yet not dull;
Strong without rage; without o'erflowing, full.*

But his proud head the airy mountain hides
Among the clouds; his shoulders and his sides
A shaggy mantle clothes; his curled brows
Frown on the gentle stream, which calmly flows
While winds and storms his lofty forehead beat,
The common fate of all that's high or great.
Low at his foot a spacious plain is placed,
Between the mountain and the stream embraced,
Which shade and shelter from the hill derives,
While the kind river wealth and beauty gives;
And in the mixture of all these appears
Variety, which all the rest endears.

CONJURERS AND SPIRITUALISTS.

IN TWO PARTS. — PART I.

DOWN to a comparatively recent period the science of spiritualism has contented itself with vagaries in the shape of rappings and various other manifestations which, while revealing the supposed presence of spirits, have presented nothing very tangible. The science has served its purpose by attracting and mystifying an audience, who, paying handsomely for an exhibition of tambourine-beating, horn-blowing, and bell-ringing in a darkened chamber, have retired more mystified than ever. The spirit, ubiquitous in its movements, has refused to be fixed. A step, however, has at length been taken in another direction; 'spirits,' though still refusing to be captured like ordinary mortals, have consented to allow themselves to be photographed! They now obediently follow those over whom they watch, to the studios of photographers, and there falling into a graceful attitude, allow those who believe themselves to be accompanied through life by a 'guardian angel' to satisfy their vanity (and credulity) by having a *carte-de-visite* taken of themselves and their 'attendant spirit.' The resulting *carte* gives such an air of reality to the affair, that it is considered rank folly to doubt any longer, when the spirits can be actually photographed, and thus brought within the ken of the most hardened sceptic.

Such piteous folly on one side and arrant deception on the other are more prevalent than ordinary folks generally suppose. A case brought to our notice from Paris will illustrate the way in which this class of photographers impose on the public. The police, hearing that a certain photographer of that city was pocketing large profits by taking these photographs for credulous people, despatched an emissary to discover the fraud. On making known his wish to be photographed with his guardian spirit, he was requested to leave the studio for a short time for the purpose of the spirit being invoked. During his absence, a plate, prepared in the ordinary way, was exposed to light

for a few seconds opposite a screen whereon a vague ghostly image was figured. The man's photograph superposed—gave, it is needless to say, the required effect. The photographer, on a hint from the police, ceased to take spirit photographs.

These photographs may also be produced by the photographer's common process of printing from two negatives; one negative takes the sitter, the other the 'spirit' as before; on printing from both, the effects are combined. Another method depends upon a curious electrical fact. If a tinfoil device be laid between two sheets of glass, and tinfoil be laid on the outer surfaces of the glass, and then electric sparks passed between the tinfoil coatings, it is found that an image of the device is formed upon the two glass plates, caused by a molecular change in the glass. This image is at first invisible, but on breathing on the glass it becomes visible, and a photograph can then be taken of it in the ordinary way.

But the cleverest plan of all is that which utilises the lately discovered optical principle known as *fluorescence*. Paint on a white screen with sulphate of quinine (which is colourless) something shadowy to represent the 'ethereal being.' Expose this to bright sunlight for a short time, and then place your unsuspecting believer in 'guardian angels' before this screen; photograph him in the ordinary way, and at the same time you obtain a picture of your painting, about which he is ignorant. Finish the photograph in the ordinary way. The quinine drawing will 'come out' hazy and indistinct as part of the picture; and then your believer in spirits, who has longed to have his 'attendant spirit' manifested to him, receives it tremblingly with gratitude. Alas for the credulity of mankind!

Without discussing in detail any more 'spiritualistic manifestations,' let us proceed to illustrate the following proposition—that conjurers, apart from any nonsense about spirits, black or white, visible or invisible, can perform, have performed, and are now performing, achievements more surprising than any *well-authenticated* cases of so-called spiritualism.

Although full of the vanity so often displayed by thorough Frenchmen, Robert-Houdin, in his *Memoirs*, gives us a reliable account of the long course of practice and study which enabled him to become the prince of conjurers, and which (we may infer) similarly fitted Frikell, Robin, Jacobs, Bosco, Hermann, Anderson, Stodare, Heller, Lynn, Maskelyne, &c. to bewilder their audiences with feats which fully equal those of the 'spirit mediums' in inexplicability, without being disfigured by the rogueries and sillinesses chargeable to too many of those who pretend that disembodied beings, supramundane or submundane, participate in the manifestations. Sir David Brewster's *Natural Magic* is full of instructive information on the possible—and in most cases verified—means of developing phenomena of a startling character in a simple way; and Sir Walter Scott's *Demonology and Witchcraft* is worth studying in a similar spirit. Dr Paris, Professor Faraday, Dr Tyndall—all have contributed to the available stock of information on these points.

As a knowledge of the physical sciences plays an important part in matters of this kind, the exhibitor, when he possesses more of this knowledge than the majority of his audience, and is withal an ingenious contriver of mechanism, has immense powers of cajoling. When Robert-Houdin went to Algeria, part of his work (at the suggestion of the French government) was to detect and expose certain Arab sorcerers, who had obtained a pernicious hold over the minds of the ignorant natives. He experienced no great difficulty in ferreting out their secrets—clever achievements, but with no more sorcery in them than in Houdin himself. What he particularly aimed at, however, was to outdo the Arabs in their own craft; to achieve, in the presence of spectators, phenomena which would plunge the sorcerers themselves into blank amazement. His famous feat in this line was, at the word of command, to reduce a strong stalwart Algerian to the weakness of a child, and then as instantly to restore his strength again. The man could or could not lift an iron box from the floor, just as Houdin willed that he should or should not. The surprise of the Arabs at this feat amounted to scare and consternation. Houdin (previously preparing his room for the purpose) had availed himself of the beautiful discovery in electro-magnetism, whereby a bar of soft iron can instantly be made a magnet by sending an electric current in coils around it, and then de-magnetised by suspending the current. How such a piece of iron below the floor of the room could be made, at the pleasure of the conjurer, to tighten and loosen the iron box resting on the floor, the reader will be able to understand by a little consideration. That most elegant of public exhibitions in England, the 'Invisible Girl,'* was the product of an inventor familiar with acoustical science; it was a skillful

application of the principle that sound will retain its power for long distances when conveyed through a tube or pipe. The tiny lady-like voice, speaking and singing in a metal globe a few inches in diameter, was one of the most inexplicable things ever brought before an audience; yet was it perfectly consistent with known physical laws. We cannot repress a belief that the Invisible Girl would have vanquished many a 'spirit-voice,' just as Robert-Houdin vanquished the Arab sorcerers.

Connected with the same acoustic principles are many public performances which never fail to excite astonishment in the minds of persons unprepared or only half-prepared to trace them to their scientific foundation. Ventriloquism ('voice issuing from the stomach') is a striking case in point. The pitch, loudness, and *timbre* or quality of a sound greatly influence our judgment in determining its direction and distance; the ventriloquist has a peculiar power of varying these conditions; and thus he can make his audience believe that sounds, really issuing from his mouth (albeit the lips may be quite motionless), come from a distance—down the chimney, up from a cellar, out of a small box, in from the street, or what not. He would be a bold man who would deny that some at least of the 'spirit-voices' of recent times are the product of successful ventriloquism. That we must not always 'believe our own ears' was amply proved by the late Mr Love, whose ventriloquistic wonders still cling to the memory of those who heard them: if ever a man's voice issued from a box that did not contain a man, it could not have deceived the audience more completely than did Mr Love's box-voice performance.

The phrase just used, 'believe our own ears,' leads us to a far more important matter connected alike with conjuring and with spiritualistic performances. It is now quite certain that we must not always 'believe our own eyes.' The retina is susceptible of being set into vibratory action by organic causes within the eye or the head itself; and a luminous sensation is experienced without, or wholly independent of, any rays of light entering the pupil of the eye. The superstitious fears entertained in the darkness of night by weak persons, especially if badness of health be superadded to ignorance and timidity, are largely dependent on luminous impressions in the eye not caused by any optical rays received from without. The optico-chemical phenomenon of phosphorescence has had much to do with the production of 'mysterious lights,' accidentally or designedly as the case may be; and many a thrilling story of 'spectral' appearances stands sadly in need of scrutiny on this ground. Let us take an incident mentioned in a recent number of the *Journal* (p. 415), and draw an inference from it. A scientific man describing some experiments he had made with phosphuretted hydrogen (the gas which produces Will-o'-the-wisp), remarks: 'On retiring to bed, I found my body quite luminous, with a glow like that of phosphorus when exposed to the air. Either

* See *Chambers's Journal*, March 18, 1876, 'Mysterious Sounds.'

some of the gas having escaped combustion, or the product of its burning, must have been absorbed into the system, and the phosphorus afterwards separated at the surface have then undergone slow combustion.' We have here italicised a few words which are well worth the reader's attention. Neither as a conjurer nor as a spiritualist, neither intending nor expecting any such phenomenon, a chemical experimenter found his body, in the darkness of night, enveloped in a weird-like spectral luminosity, well calculated to give origin to a narrative of 'spirit-lights' to those who believe in such things.

Personal peculiarities are largely concerned in some conjuring tricks. Robert-Houdin, when a youth, saw an exhibitor spitted through the body with a sword; and when himself an experienced conjurer, shewed how this might be done. If the man were spare of body, tightly compressed round the middle, and provided with a false abdomen, a sword might be passed right through his apparent body without lacerating or even touching his skin. A seeming stabbing through the nose with a penknife, and the sword-swallowing trick, he similarly unmasked by careful observation. The 'rope trick,' in which the conjurers fully equal the spiritualists, illustrates the remarkable way in which the muscles can, in some persons, be distended and contracted at pleasure. By a strong indraught of breath, and an exercise of will, a man can really expand his circumference, or that of his arms, during the tying of a rope, and collapse again when the time for self-untying has arrived. Some individuals are so strangely jointed that they can perform apparent miracles upon themselves in an instant. A celebrated exemplar of this class was Joseph Clark, a posturer in the time of Charles II. He was so exceptionally formed, and had such absolute command of muscles and joints, that he could become as it were *some one else* in a moment: now a hunchback; now an obese man, as if 'with good capon lined'; now a skin-and-grief; and anon with one foot heel foremost and the other toe foremost. He thoroughly deceived a distinguished surgeon once, who dismissed him as a hopeless cripple; and on another occasion bewildered a tailor by an inexplicable change of bulk and shape when new garments were taken home.

Digital, ocular, and bodily expertness acquired by long practice in particular ways, help many a conjurer to achieve results which (in other circles) would be attributed to 'spirits.' Robert-Houdin trained himself and his little son, during many walks through the streets of Paris, to a wonderful quickness of eye in discriminating dozens of different objects seen merely at a glance. Passing a toy-shop, father and son would try which could remember and name the greatest number of trinkets displayed in the window; or at a book-seller's, the greatest number of titles of books and names of authors—merely by a glance while walking slowly along. He humorously, but probably with some truth, declared that the gentler sex especially can do this in their own particular way; let one lady pass another in the street, and, with surprising quickness, each will have scanned the dress of the other from top to toe, from hat-feather to boots, so as to be able to describe and criticise it with wondrous minuteness in regard to colour, shape, material, quality, and

condition. Success in this rapid discrimination has much to do with the *clairvoyant* exhibitions of the superior grade of conjurers. Numerous small articles, held up by the visitors in the room, are discriminated and mentally catalogued in an instant; and the experimenter, in questioning the blindfolded confederate, uses such words (previously agreed upon) as will suggest the proper answer to the question itself. Robert-Houdin was, we believe, the inventor of this capital trick, in which he has been followed with more or less success by imitators of both sexes; he never professed for an instant to be guided by 'spirits,' yet his clairvoyance was quite as surprising as that of the so-called 'mediums.' Expertness of fingers is another of the items in the training of a successful conjurer. The tricks with cards, which so thoroughly baffle ordinary spectators, depend mostly on a delicacy of touch which few of us can appreciate. The plate-spinning of circus and acrobatic performers, surprising in its appearance, is due simply to the effect of centrifugal motion (produced by slight movements of the performer's hands) in preventing the plate from falling on one side rather than another. A trained eye and trained hand act in conjunction in the feat of keeping up four balls in the air while the performer is reading a book; while trained eye, muscles, and powers of equilibrium are all brought into requisition by the circus rider, who spins several plates and tosses several balls while galloping round the arena.

In another paper we shall notice the inexplicable nature of some kinds of *automatic* exhibitions, such as those performed by Messrs Maskeyne and Cooke.

FALLEN FORTUNES.

CHAPTER I.—MR HOLT MAKES JEFF HIS CONFIDANT.

UNDER ordinary circumstances, Mr Holt could scarcely have made an observation so displeasing, and calculated to set his companion at odds with him, as that most unexpected one with respect to Kitty; but the tone in which it was uttered, and the look that accompanied it, disarmed the young fellow altogether; nay, more, it filled his soul with compassion for this beaten wretch. For if ever a man looked beaten in the battle of life, not at one point, but at all, and not only beaten, but broken and utterly despairing, it was the once prosperous, and demonstratively prosperous, Richard Holt.

'Does Kitty know of all this, Jeff?'

The use of the two familiar names was most significant, since they comprised not only a confession of hopeless love, but an appeal to the generosity of his rival. 'Tell me,' it seemed to say, 'for mercy's sake, if I am lost in the eyes of her I love, as well as in those of the rest of the world; or whether, so far as she is concerned, I can still hold up my head? I appeal to you, because your heart is kind and sound, and you are one neither to lie to me, nor, though I am helpless and fallen, to tread me under foot.'

'Kitty does not know, Mr Holt—as yet,' answered Jeff hesitatingly.

'And yet you knew, and did not tell her!' put in the other quickly. 'There are few men in your case who would have waited so long. Her

father, however, has perhaps informed her this morning?"

"No, Mr Holt; it was arranged that she is to be told nothing till he has had your reply to his letter."

"Then I will give him his reply," answered the other calmly. He opened a little box that lay on his office desk, and took from it a sheet of figures. "Here is my account with John Dalton," said he, "which you can presently examine at your leisure. He will find that I was a more honest man than he took me for—up to yonder date," pointing it out with his finger. "The *Lara* itself was a *haut-fide* investment in the first instance. He and I both made money out of it, and would have continued to do so legitimately, but for my passion for the girl you love. That was what drove me to my ruin. Ah, you do not comprehend that! If you loved her, as I did—and as I do—it would be easier for you to understand it.—Nay, forgive me. I was wrong there. An honest love doubtless takes honest ways, and only those, to win its object. Call mine dishonest, then, if you will; yet it was genuine of its sort, believe me. Its nature was devoting, and I denied it nothing—honour, reputation, self-respect, were all thrown into that fatal flame. From the first moment that I beheld her, I swore to make that girl my wife; and now I shall die perjured." He smiled a wretched smile, and sighed, then wearily went on: "Her father would have none of me. He had opened the doors of his house to me with reluctance, and I found no favour there. In vain I worked for him and enriched him. When I ventured upon ever so slight an approach to familiarity with those belonging to him, he took no pains to conceal his annoyance—his astonishment at my presumption. I had some pride of my own also, and this wounded me to the quick. Since I had no chance to attain my object while he was prosperous, I resolved to ruin him."

Jeff uttered an exclamation of disgust.

"I am sorry to offend you, Mr Derwent; but this is a relation of facts. The last dying speech and confession of a man under the gallows, you know" (here he smiled again, if possible more ghastly than before), "does not concern itself with sentiment. I had tried fair means to no purpose; and I was not to be balked. I could not bend John Dalton, so I resolved to break him. Hitherto he had been, practically speaking, my partner in all the business we transacted with one another; now I made him unconsciously my confederate. I set rumours afloat about the *Lara*, which brought down the shares, and then I bought them up. In the end, Dalton and I possessed the mine between us, though I told him afterwards that I had parted with all my interest in it. Whatever we had now to do in concert, I secured the lion's share of profit for myself—it is all there" (he pointed to the schedule) "in black and white—not because I was grasping, but because I wished to dock his gains. When there was loss, it was he who chiefly suffered. I fed his ambition, and encouraged him to make a figure in politics as well as commerce; knowing that politics would cost him money and not fill his pocket, as they do with some men. When funds began to fail him, I matured my scheme concerning the mine. I sent a creature of my own (the "expert" Tobbit) to Brazil, to report upon the *Lara*—to the English shareholders (in reality to Dalton and myself), with instructions to

declare it valueless; with what success you know. Still I could not get Dalton to dispose of his shares: some influence was at work—I now feel certain it must have been that of Astor—to induce him to hold them. His resolve to go to Brazil to look into matters for himself, filled me with dismay, yet I strove in vain to hinder him. When he had once embarked, it was, I knew, but a question of a few months, and then my fraud would be exposed. But if I could only have secured Kitty in the meantime, that would not have disturbed me. To that end I applied every means in my power; but though I had a keen ally in Mrs Campden, I made no progress. You will learn all that from other sources. You know, even though the *Elmborough Head* went down, and Fortune seemed to favour me to the uttermost, and to turn her back upon those weak ones with whom I warred, that I was never Kitty's accepted suitor."

Jeff was not quick at figures, but he could calculate better than any man what it cost his defeated rival to say those words. And yet even he knew not their full meaning. This unhappy wretch was not all evil (as some of us are, I fear, in spite of some philosophic observers who have reported to the contrary); since he could not marry Kitty himself, he was willing that the man who might, and who certainly deserved to, do so, should be quite clear in his own mind that his wife had never plighted troth—no matter under what circumstances—to another; he was willing that this should be, and he was above measure desirous that Kitty in accepting Jeff should on her part feel uncompromised as respected himself. It was not all generosity—though people can afford to be generous when making their wills; he was solicitous that his memory at least should not be odious to Kitty.

"Do I speak plainly, Mr Derwent?" said Holt, after a short pause.

"You are giving yourself unnecessary pain, sir," answered the young fellow kindly; "as for me, I am but a messenger to carry back to those who sent me your acceptance of certain terms."

"That is true; but confession, they say, is good for the soul, and I prefer you to any priest, Jeff." He was right there, so far as all events as making his peace in this world was concerned. He knew that in that young and generous nature he should find such an apologist as he would have looked for in vain elsewhere; and that apologist would have the ear of her whose censure or contempt alone had terrors for him. "As for the terms you speak of," he went on, "I have no choice but to accept them. The figures I have given you will shew my indebtedness to Mr Dalton, to which the interest shall be added. The calculation will take a little time perhaps a few hours; may I ask, until they have expired, that this"—here his face shewed a tinge of colour—"this matter of business may not be spoken of, save among those to whom it is already known?"

"So far as I have any influence, Mr Holt, you may depend"—

"I ask no more, save one thing," interrupted the other with a wave of his hand; the first recurrence he had made to his favourite continental manner. "Though easily granted, it is a great favour, but it is the last I shall ever seek from you.—You hesitate to pledge yourself beforehand," added he with

a faint smile: 'that is only natural under the circumstances. However, this little matter can be performed "without prejudice," as the lawyers say: there is no dishonesty in it, I assure you; no harm to any one, but some good, or at least some pleasure to me, whose pleasures are mostly come to an end.'

'I will do it, sir,' said the young fellow simply.

'Then good-bye, Jeff; and may your life be a brighter and a better one than mine has been.'

'But the favour, sir?' said the young fellow, greatly moved.

'Oh, it was merely that—that you would shake hands with me.' He did so. 'After all that has come and gone, I was more than doubtful whether you would. It cost you something, Jeff, I saw; but in the end you will not repent it.'

Then resuming his usual business manner, he added: 'John Dalton shall receive all his dues by to-morrow morning at latest; and your salary will be sent to you, up to this date, by the same post. I am sorry that circumstances have caused us to part company, Mr Derwent; but needs must when the evil one drives, and he was certainly the coachman in this case. As for to-day, I have much business of a private nature to arrange, and have no further occasion for your services.'

As he said those words, he sat down, and took up his pen; Geoffrey bowed and left the room, and in a few minutes the office. His leave-taking had been altogether different from anything he could have imagined, and puzzled him, now that it was over, even more than during its occurrence. The tone and manner of the speaker had seemed to explain much at the time, but now they were absent, his memory failed to supply them; the lights of the picture were wanting, and the impression it produced upon him was one of unmitigated gloom.

Its tints would have been darker yet if he could have looked—but a few hours—into the future.

CHAPTER II.—HOW MR HOLT HASTENED MATTERS.

In spite of all that had happened to the family in whom Geoffrey Derwent had so large an interest—the return of Dalton, his recovered wealth, which would once more reinstate those belonging to him in their former position; and his own prospects, which had altered so materially for the worse (for the 'opening' which he had looked for in business was now closed, and the gulf between him and Kitty yawned as wide as ever)—in spite of all these important considerations, Jeff's mind, as he turned his steps towards Islington, was mainly occupied with his late employer. Notwithstanding all the villainy to which he had confessed, the young fellow's heart was pitiful towards him; not a word of sorrow for his delinquencies against Dalton had passed his lips, though he had promised material reparation; but on the other hand his sensitiveness as respected Kitty had been extreme. It was for her—though selfishly—that he had sinned—had gone through the fire of shame and the foul water of fraud; and Jeff's own great love for her—though it would never have thus led him astray—made excuses for his rival. He pictured him during those weeks when Dalton had first sailed from England, and he must have been expecting day by day the tidings of the exposure of his crime,

and pitied him. It was perhaps pity misplaced, for Holt was a man with nerves of iron; a man, too, of means and subtle device, whom the Law could not have thrown on his luck like a turtle (as it throws the poor and dull who transgress it) to await trial and sentence; but judging his case by what his own would have been in the like conditions, and also taking into consideration the fact that the man was down, and harmless, Jeff on the whole was glad that he had given him the hand, not indeed of friendship, but forgiveness.

Jeff's day was all his own—as many days to come were, alas! likely to be—yet he hesitated to visit Brown Street, where of late he had been so unwelcome. Moreover, he feared that he should be subject to questioning there upon the events of the day, which recent experience warned him that he was not fitted to undergo; he entertained the just conviction that Jenny would have 'turned him inside out' (as they say at the Old Bailey) in five minutes of cross-examination. He resolved to go, therefore, to Dalton's lodgings, and there leave a line to state the result of his interview with Holt, with that proviso added as to 'the date of publication' of it, and then pass the time as he could till evening. He found, however, a note at the house awaiting him, asking him to come on to Brown Street to dinner; an invitation which he had not the courage—or the cowardice—to refuse.

He found the family all in high spirits, with one exception. Dalton indeed was not so debonair and joyous as he had been wont to be; his manner had something of sardonic exultation, in place of its old *abandon*, and it became him less. He had been hard hit, and he was a man not used to blows; such men return them with interest, and feel a pleasure in the repayment. A rapid glance had passed between him and Jeff, which assured him that his enemy was vanquished. Jenny, bright, gay, and frail as a bird, was full of fun, with every now and then a dash of spleen among her sprightliness, like a sparrow turned sparrow-hawk; she had been hit too (for was not each slight a blow to one so fragile), and was not one to forget it. The sudden change for the better in the sick girl shewed how much mental trouble and material privations had had to do with her malady. Tony was in tearing spirits, now dancing about his father, now romping with Uncle Philip, whom he had taken to as naturally as though he had been a member of the family from the first. Only Kitty was not merry: when her face was turned towards her father or Jenny, it beamed indeed with smiles; a sense of gratitude seemed to environ her like an atmosphere; but she was strangely silent, and when not addressed, had a grave and quiet look, that reminded one more of resignation than contentment. Perhaps, Jeff dared to hope, she had been reflecting, like himself, that the course of true love was not likely to run smoother than of yore with them; that this new-found prosperity, while it made self-sacrifice unnecessary, would still be a fatal obstacle to her heart's desire. For that she knew that she was once more prosperous, was certain. The air of the whole party convinced him that such was the case, and especially the air of good Nurse Haywood, who waited upon them at dinner in person, and treated 'Master John,' as she still persisted in calling Dalton, like a prince who has not only returned to his native land, but come back to enjoy his own again. He would have had

of her best as long as it lasted—had he been a beggar, but her behaviour would in that case have been less unlike a prolonged flourish of trumpets. Indeed it might be said that there were cymbals also, for in her excitement and exultation she clashed the plates together and broke a couple.

'It doesn't matter, if there are enough left to go round,' said Dalton.

'Thank goodness, it doesn't,' Master John, answered the old lady; 'for there are plenty *now* where those came from.'

She had got some bottles of champagne from the public-house, the whole of which she would have dispensed to the company, and thereby have poisoned them, for the Brown Street vintage was execrable.

'I am afraid you don't like it, sir,' said she, aggrieved; 'but it was the best I could get at such a short notice.'

'The wine is excellent, nurse,' said Dalton gravely; 'but one bottle is quite sufficient to drink the health of all our friends in.'

The list of toasts indeed was short enough. They drank Dr Curzon's health; and, in spite of her remonstrances, they drank to Nurse Haywood herself, the men shaking hands with her, and the two girls overwhelming her with caresses. It would certainly have been no exaggeration had she observed in acknowledgment, that it was the proudest moment of her life; her only reply, however, and the only one that came natural to her, was—a flood of tears.

When the ladies had retired, taking Tony the reluctant (who, so far from finding fault with the Brown Street champagne, had done ample justice to it) with them, Dalton laid his hand on Geoffrey's shoulder.

'And now, lad, for your news from Abdell Court. I need not ask if it be good news, for I have read so much as that already in your face.'

'Yes, sir; it is good news. Mr Holt admits all that is urged against him, and promises to make the completest reparation; only for a few hours—the time he named, indeed, must have elapsed by now—he begged to be spared exposure.'

'What did the fellow mean?' inquired Dalton angrily. 'Did he want to shut my mouth, if a man had asked me any time to-day, is Richard Holt a villain?'

'I think he merely meant that until you had heard from him this evening, he hoped you would not make his shame known to your own family.'

'My family!' echoed Dalton scornfully. 'The scoundrel has small claim to forbearance as respects them, I reckon. Do you know, man,' added he with stern solemnity, 'that it is thanks to him that my dear wife is lying in her grave at Sanbeck?'

It was certainly true that through Holt's fraud, Dalton had been forced to leave the country, and that out of his absence had arisen the catastrophe at the Nook.

Jeff hung his head; the argument had gone home to him; he felt he had nothing more to say for the unhappy wretch, whose hand he had taken that day for the last time.

'Come,' said Dalton; 'let us not think of villains to-night. There was one toast, Jeff, I didn't propose while the girls were here, because I wished to save your blushes; but I mean to drink it now.

—Philip, fill your glass; the sherry, I think, is a little less deadly than that champagne. As good wine needs no bush—if the converse be true, by-the-by, this wine should require a thicket—so a toast that we drink with all our hearts needs no speech. My toast is Geoffrey Derwent. You don't know him, Philip, as I know him (nor did I know him, for that matter, as I ought to have known him, till within the last two days). But you may take my word for it, that young as he is, a truer heart, or one more to be relied upon, in times that try men's hearts and shew what stuff they are made of, does not beat than his—I need not repeat the story; but Jenny has told me all about you, Jeff; and if Kitty has told me nothing, there has been, I daresay, some very good reasons for her silence. I have no secrets from Philip here, not even that one; and I have a particular object in saying what I have to say before Philip. His notion is, that with returning prosperity, I shall fall into the old track; that "the deceitfulness of riches" —

'I never said so, John,' interrupted Philip; 'I only thought'—

'Well, you see, he *thought* it,' put in Dalton quickly, 'and that is quite as bad. To put the matter beyond question, however, so far as you are concerned, Jeff, I wish, in Philip's presence, to remind you of a certain confession you made to me with respect to Kitty, when you and I parted company at Riverside. Do you remember what it was, Jeff?'

'Yes, indeed; I remember very well, sir.'

'And do you recollect what I said to you in reply?'

'You said you would talk to me about that when you came back again.'

'Very good; and now, you see, I am keeping my promise. Well, if you still love Kitty, and she loves you, she is yours, Jeff!'

'O sir, you are too good!' cried Jeff, his heart bounding with joy and gratitude, though conscious of a doubt. 'But, alas! I have nothing; and Kitty will be rich; and people will say'—

'Let them say what they like, and be hanged!' cried Dalton violently. 'If "people"—by which I suppose you mean one's friends—would say a little less, and do a little more, when occasion demands it, their opinion would be of more consequence.' He pushed his chair back from the table, and began walking up and down the little room as he went volubly on: 'It has always of course been acknowledged of Society, even by the prosperous, that she was "frivolous" and "hollow," and all that sort of thing; but I could not have imagined, unless I had experienced it myself, how worthless and rotten at the core the creature is. The women are worse than the men, because they protest so much. To think of the scores of them that have smirked and smiled, and asked me after my "dear girls" with such tender sympathy; and then, when one's back was turned—as they thought for good—and these same "dear" ones were left helpless and penniless, how not one—not *one* of these fine folks would hold a finger out, or even say a word of comfort! No, Jeff; don't talk to me of what "people" may "say," or I shall be tempted to think that those who are not knives in the world must needs be the other thing.'

Philip sat back in his chair, jingling some half-pence in his pocket—probably all the money he

had—and very much applauding these remarks; but a keener observer would perhaps have had a suspicion that Dalton was working himself up to this display of vehemence, or, at all events, found it necessary to nurse his wrath in order to keep it warm. The fact was, not only was his nature eminently genial, and inapt for receiving deep impressions, especially of an unpleasant sort, but second nature—*nse*—had made him regard the very class of persons he was now anathematising, as his own world, beyond which he had few sympathies. His feelings, however, with respect to Geoffrey Derwent were genuinely what he described them to be, and he was perfectly honest in the offer he had just made him of his daughter's hand.

'Perhaps you would like to go up-stairs, my lad, and have a few words with Kitty,' added he kindly, 'while we old fellows smoke a cigar;' as he spoke he threw open the window, admitting a little air, a good deal of dust, and the growing chorus of some street-hawkers, who at that period of the evening were wont to 'work' Brown Street, and supply it with the latest sensational intelligence.

Jeff smiled his thanks, and left the room; but his step on the narrow staircase was not that of a lover who has 'asked papa' with success; and on the landing he paused for full a minute, weighing this and that, in most unlover-like fashion; for, with all his good qualities—among which a loving heart was not certainly wanting—Jeff was intensely proud. His darling hope had been, if only circumstances had permitted it, that he might have made for himself some position in the world—humble but not despicable, and such as he could have lifted Kitty out of her difficulties to share.

In wedding her as things were, he would not indeed be marrying her for money; but the inequality in their fortunes jarred upon his sensitive feelings. Among such natures—for low ones find no difficulty in the matter—it requires a strong mind and an exceptionally wholesome one to accept a pecuniary obligation without repugnance. The worship of money is so universal, that even those who ought to know it is a mere idol are apt to treat it as a sacred thing.

In the drawing-room he found Kitty seated close to her sister, with the latter's arm about her waist. It was generally Jenny who 'did the talking' when they were alone together, and she had evidently been doing it on this occasion. Kitty had the downcast looks of a listener who has been preached at.

'Talk of Jeff, and he makes his appearance!' said Jenny sancily.

'I hope I am not intruding?' observed he humbly.

'You are intruding on *me*, sir,' said Jenny, rising from her chair. 'I have had quite enough of you below-stairs for the present;' and off she tripped, leaving the two young people alone. The window was open here, as in the room below, but the dust was less, and the wind that passed over the flower-box on the sill brought charming odours with it.

'Kitty, dear, your father has been speaking to me most kindly,' said Jeff hesitatingly.

'He is always kind, and in your case can never, I am sure, be otherwise, Jeff,' answered she steadily. 'He knows that he owes you very much.'

'I don't feel that, Kitty; but I feel that whatever he owes me, or can owe me, it can never be

so much by a hundred times as what he says he is prepared to give me. Can you guess, Kitty, darling, what that is?'

'Jeff—Geoffrey,' said she, in distressed tones, 'did you not promise at the Nook?'

'Yes, dear,' interrupted he; 'but that was different. The circumstances are altogether changed. They are not indeed as I could wish them to be, even yet. I am poor, I may say penniless, when compared with you.'

'O Jeff, how dare you!' exclaimed Kitty, rising angrily from her seat. 'Do you suppose I am thinking of money? Of course, I have had to think about it of late—for others; but in a matter that concerns myself alone, can you think that your being poor or rich can draw me, by a hair's-breadth, one way or another!'

'It draws me, Kate,' cried Jeff simply. 'It is the only thing that draws me—just a hair's-breadth—away from you. I thought, when I spoke to you at the Nook, that it was the reflection how ill off we both were as respected means; and that, in your unselfishness and generosity, you felt it right to be the prop and stay of your own household, and not to look outside of it, even for such love as mine.'

'It was partly that, Jeff; but also, even then, there was another contingency, and that, alas!—the other obstacle, I mean—has grown and grown; indeed, I don't know how I stand respecting it. I—I—you must please to give me time, Jeff; and I can't promise; indeed, I can't.'

'But you have promised no one else, Kitty?'

'No; at least not exactly; but'

The shouting of the hawkers in the street was growing nearer and nearer: as one on one side, and one on the other, they bawled together, like singers in a glee who are out of tune, it needed a practical ear to catch a word.

'This man is dreadful,' muttered Jeff; and moving quickly to the window, he pulled up the sash and shut out the sound.

'You need time, Kitty, to think it over,' said Jeff softly; 'well, let it be so; I was not impatient, you know, before.'

It was not impatience, nor yet disappointment, nor distress, that agitated the speaker; yet his face had blanched, and wore an expression anxious and *distract*. But Kitty's eyes were fixed upon the floor, and saw him not.

'No; you were patient, and good, and kind, as you ever were, Jeff,' answered she tenderly. 'Whatever happens, I shall always think of you as—all that. But indeed I must have time.'

'I am going now,' said Jeff, and indeed his hand was already on the door. Never surely were two fond lovers so willing that time and space should separate them, as these two seemed to be.

Throughout the day, from the moment her father had told her better times had come to them—he could no longer deny himself that pleasure, though he had forborne to speak of how his fortune was about to be restored to him—Kitty had been revolving in her mind her position as respected *Holt*. The money that he had advanced for the life-insurance premium would now be repaid to him of course, but could that acquit her of her obligation? and if it did, would it release her from the implied though unexpressed consent she had given to accept of his attentions? It was easy to break with him indeed, but could it be done with a good conscience?

In her heart of hearts, Kitty knew she had made up her mind to marry this man, and she feared that he knew she had done so. To marry him now—all the forces that had driven her towards him having suddenly ceased to exert their influence, while the dead-weight of dislike still drew her in the opposite direction—she felt to be impossible; but she also felt, notwithstanding the arguments which Jenny had just been pouring into her ear, and the still stronger claims which love itself, in the person of Jeff, was urging, that much, very much was owed to Richard Holt; indeed that all was owed by rights, only that the debt was too excessive for payment. At all events it was for him to impose what terms he pleased in default of its discharge. Until she had confessed to him that notwithstanding all that had come and gone she could never be his wife, she felt at least that it was unbecoming to speak of marriage with another. Hence it was she had said: 'I must have time.'

And Jeff needed 'time' too, though for a very different purpose. He could not understand her scruples, for had not Mr Holt himself said: 'I have wooed her without success'; yet he felt confident that the obstacle to which she had alluded was Holt, and no other. He was not at liberty—or did not feel himself to be so—to say that this man had already renounced his claim, if claim he had upon her; but something had suddenly taken place which might set her at liberty another way. And yet, to do Jeff justice, it was not that thought which was paramount in his mind, as, having quitted the presence of his beloved Kitty, he flew down-stairs, and snatching up his hat, let himself softly out of doors. Through the open window on his left he could hear Dalton and his half-brother talking earnestly over their cigars; he even caught the name of 'Holt' coupled with some adjective, expressive of contempt and loathing: it was strange, considering what he knew of the man, that he should feel pained to hear it; but so it was.

Then turning to the right hand, he sped away after the two street-hawkers, who, having cried themselves hoarse, were just about to enter the public-house at the corner, to refresh themselves with purl—a liquor as popular with gentlemen of their calling as Dublin stout is said to be with our fashionable sopranos.

'I want a copy of your paper; quick!' he said, as he came up with them.

'Well, you see, sir, it's the last we have,' grumbled the man addressed; 'and I don't think as sixpence is too much'—

Jeff threw him a shilling and snatched the newspaper out of his hands, unconscious of the muttered remark of the vendor's partner: 'Why didn't you ask the chap a sufferin' for it?' He was a political economist of the soundest type, and had seen the necessity, which the other had omitted to see and take advantage of.

Jeff's practised eye lighted at once upon the big letters—'Suicide Extraordinary in Abdell Court.'

He had caught the name as he had sat at the open window, though it had escaped the ears of those who were less familiar with it, and at once associated the catastrophe with his late employer. His air and manner during their late interview were quite in consonance with such a deed, and even (as he now thought) his shameless candour.

Had not the wretched man himself likened it to a confession at the gallows foot!

Within five hours or so of Jeff's parting with him at the office, Richard Holt had destroyed himself.

LOSSES OF JEWELS.

SOME strange stories could be told of the losses of jewels and other valuable articles that have been recovered in a remarkable manner, or have altogether disappeared. We may relate a few incidents of this kind, for the entertainment of our readers.

During the Indian Mutiny, and after the destruction of some of the rich palaces and temples, the soldiers picked up many valuable articles, useless to themselves, and which they frequently threw away again, as troublesome to carry; or gladly sold to any one who would give them a few rupees in exchange. Among these acquisitions was a large, very roughly cut diamond, which had been one of the eyes of a gorgeously painted idol, enshrined in one of the temples that had been destroyed. A soldier picked it out of its socket, and as it was a rough, dull-looking stone, he thought very little of it, and was just going to throw it away, when an officer who stood by offered him two or three rupees for it. He also put but small store by his purchase of the lustreless stone; and it was only from its position as the eye of an idol that he judged it might possibly be of greater value than seemed likely from its outward appearance. Some time afterwards he shewed it to a native jeweller, who offered to buy it from him at a considerable increase on the price he had given for it; but he was going to England, and thought it wiser to take the stone with him, and have it properly cut by a first-class lapidary. This was done, and a very fine stone resulted; which the jeweller, at the most moderate calculation, valued at five hundred pounds. The officer had it set in a ring, and wore it for several years quite safely; but one day, chancing to be in London, he went into a shop to buy a pair of gloves, and looking at the ring on his little finger, he observed that the setting was empty, the diamond gone. He examined his glove, his pockets, the floor of the shop; no trace of the stone was to be seen, and so he gave it up as lost. However, he mentioned the matter at his club; and told the club-masquer to post up a notice offering ten pounds reward to any one who should find the diamond. A day or two afterwards the stone was brought to him. It had been found by one of the housemaids in a darkish passage that led to the billiard-room. The reward was gladly paid, and the diamond taken to the jeweller's, to be once more firmly replaced in the ring.

Again some years passed. The officer had been back to India, and was on furlough in this country, and had gone to Scotland to shoot with friends who had taken a moor in the Highlands. One hot August day he had been out for several hours tramping over miles and miles of close heather, grouse-shooting. He was still walking, when a covey of birds rose a little way off. He raised his gun to take aim, when his eye chanced to fall on his ring, and he saw that the setting was once more empty. Stopping to look at it, the

birds got away; and he laid down the gun on the heather beside him, and carefully examined the place where he stood with a very feeble hope of finding the glittering stone. Nothing was to be seen of it; and when he recollected the many miles he had traversed that day, and the nature of the ground he had been on, he abandoned all idea of ever again recovering his diamond. He stooped for his gun, and the thought flashed into his mind: 'I'll turn out the charge—the thing is just possible!' He did so; drew the wad, and then shook out the contents of the barrel, shot, powder, and—the diamond! It had slipped unnoticed into the muzzle when he was loading; and but for the lucky chance that had caused him to remark its absence from the ring, it would have been fired away the next moment. Possibly it might have hit a bird, gone back in the same bag, and caused as much amazement to the cook, or to the individual who found it between his teeth, as did the diamond in the eastern tale to the fisherman and his family who discovered it in the entrails of the fish. Another visit to the jeweller, and the ring resumed its place on the finger of its owner, and three or four years passed away. The officer had again returned to India, and was with his regiment, which was encamped near a large station, portions of some other regiments being close to them. He was acting as adjutant to the general in command, and was writing at a small table placed close to the door of his tent. As his hand passed rapidly over the paper, the troublesome diamond once more dropped from its setting, and fell on the table beside him. Being in a hurry, he merely uttered an angry exclamation, pushed the stone close to the inkstand, and went on with his writing. Presently a messenger came to say that the general wished to see him immediately. He forgot all about the stone, threw on his uniform, buckled on his sword, and started at once for the quarters of the commanding officer. He was detained some little time; and when he returned to his own tent, he looked directly for the diamond, which he had meanwhile recollected; but it was gone! A thief had been there during his absence, had seen and appropriated the stone; and he never saw or heard of it again, though he offered a liberal reward for its restoration.

Our next story relates to a young married lady who came with her husband to pay a visit to friends who lived in the country, very close to a small rural village. There were little children at home; and on the day preceding her return, the lady went to the village shop to purchase some trifling gifts for the juveniles. She took off her glove to get the silver from her purse; and as the day was warm, and the distance she had to return very short, she did not put the glove on again, but carried it back in her hand. When she reached the house she sat down and exhibited her purchases to her husband and friends. Suddenly she started and exclaimed: 'O my ring! I've lost my diamond ring!' On the third finger of her right hand she had worn a valuable diamond ring. It was too wide for her, and she had frequently intended to have its size reduced; but this precaution had hitherto been neglected, and she did not ordinarily wear it, from a dread of the misfortune that had now occurred.

Every one was immediately on the alert. The

village was small; perfect honesty prevalent among its inhabitants, and there had been no one in the shop when the lady was there, and only one or two of the villagers since, who had not been observed to pick up anything. The floor of the shop was thoroughly searched in every corner; the room where the lady had been sitting and also her bedroom were closely examined; but nothing could be seen of the ring. As she was positive that it had been on her hand just before she went out, for she distinctly remembered twirling it round and round with her fingers, a band of the village children was collected, arranged in a row, and desired to search the ground of the short avenue and the road to the shop as minutely as possible; proper remuneration being promised, and a tempting reward held out to the finder of the ring. They did their work very diligently; but it was all in vain. No trace of the ring was to be seen; and the lady reluctantly admitted that she had brought the mischance entirely on herself, by neglecting the trifling alteration that would have prevented it.

Many months passed away. The friends whom the lady had been visiting had gone from home for a time; and in their absence the servants gave the house a thorough cleaning from top to bottom. They came to the library, the room usually occupied in the morning, and which was almost entirely surrounded by book-shelves, filled with the works of ancient and modern authors. Shelf after shelf was cleared of its contents; and in the course of operations they came to one containing a collection of antique volumes, rare from their choice binding and from the nature of their contents, subjects eschewed by the ordinary class of novel-readers or students of light literature. As one of those heavy volumes was gently removed from its resting-place, something fell from it and rolled to the back of the shelf. One of the servants stooped down to see what it was, and the next moment triumphantly displayed in her hand the long-lost diamond ring!

It transpired afterwards that just before she went to the village shop the lady had been examining some of the shelves in the library, and had taken out several of the massive volumes we have mentioned, to make a nearer inspection of them. When finished, she replaced them in the shelves; and at that time the too wide ring must have fallen unperceived from her finger, and rested on the top of the book, which had not been touched from that day till the one on which it was so unexpectedly discovered.

Another curious loss and recovery of a ring was as follows. A young lady, engaged to be married, had received many beautiful gifts from her betrothed, one of them being a valuable sapphire ring. She had been out walking with him one afternoon, and on her return home she observed a parcel of new music that had just arrived for her. Sitting down to the piano, she played over several of the pieces, chatting occasionally as she did so with her mother and sisters, who were at work in the drawing-room. Soon afterwards they all went up-stairs to dress for dinner, and owing to the time that had been spent over the new music, were rather hurried in their movements, as it was close on the dinner-hour. The bell sounded almost before the young lady was ready, and hastily finishing her toilet, she ran down to join the circle in the drawing-room.

Proceeding to the dining-room, she found that she had neglected to put on her rings, and calling one of the servants, she desired him to tell her maid that she would find them lying on the wash-hand stand, as she had laid them there before washing her hands. The man quitted the room, and returned in a few minutes, carrying the rings on a small salver. The young lady took them up, glanced at them, and said: 'There ought to be one more—my sapphire ring. Please to go back to Smith, and ask her to look for it.'

He went, was absent rather longer this time, and on his return informed his young mistress that no other ring was to be seen.

'Oh, it must be there,' said the young lady. 'I laid them all down together. However, I'll go and look myself after dinner.'

She did so, and her sisters with her; but no sapphire ring rewarded their search; and the young lady became very much distressed, not only on account of the value of the ring, but because it was a present from her lover, and a family jewel very much prized by him. 'The ring *was* there, and *must* be found,' she said very decidedly; and once more they all prosecuted a totally unavailing search.

Matters began to look serious. The young lady's mother appeared on the scene, and looked and spoke very gravely upon the subject. The lady's-maid's character was unimpeachable; she had been more than ten years in the family, and was a thoroughly trusted servant. She declared solemnly that on receiving the message she went at once to the wash-hand stand and found four rings lying on it: the sapphire ring was not there, for she knew its appearance perfectly. She did not think of looking more particularly for it, as the rings were all close together; and she handed the four she saw to the man-servant.

Then came a very unpleasant surmise: had any one else been in the room? Inquiry elicited the fact that a young girl who had recently come as under-housemaid had entered the room very soon after the young lady had gone down to dinner. Suspicion pointed disagreeably towards her as the only person who could possibly have taken the ring; and yet the whole family felt very much averse to charge her with the theft. She was a pretty and very respectable-looking girl; but she had only been a week or two in the house, and nothing was known as to her antecedents beyond the circumstance of her having been well recommended by her previous mistress. The mother of the family took the girl aside privately, and told her that they feared she had been tempted to steal the jewel; urging her, if she had done so, to confess her fault and restore the ring immediately, and her fault would be overlooked. In an agony of grief and indignation the girl warmly protested her innocence; begging that a detective might be sent for directly to examine her boxes, a request in which all the other domestics concurred.

An officer was fetched, and a narrow inspection made; but nothing could be seen of the missing ring. Suspicion still remained attached to the unfortunate young housemaid, who, it was concluded, might have found means skilfully to conceal the ring; there was no proof against her, but the cold looks of the other servants were more than she could endure; so she threw up her situation

and went home with a tarnished name and a breaking heart.

Several days passed away, and the young lady was sadly distressed for the loss of her ring, and vowed over and over again that she would never again leave her jewels exposed in such a careless manner; she was now also much vexed about the poor young housemaid, and blamed herself for having thrown temptation in her way. It so happened that she had not been out of doors since the day of the unfortunate occurrence, the weather having been cold and wet, and her occupations detaining her a good deal at home; but a bright pleasant morning appeared, and she arranged to go out after breakfast with one of her sisters. The maid looked out her walking-things; and the fair *fiancée* donned her bonnet and sealskin jacket, and then took up her muff, which had been laid on the toilet-table beside her. She drew out her hand again directly, and with it a pair of kid gloves, and as she put them down one of them fell rather heavily on the table.

'What is that?' she exclaimed. Taking up the glove, she felt a small, hard object inside one of the fingers. A deep burning flush dyed cheek and brow, to be instantly succeeded by a deathly paleness. Sinking down on a chair, she covered her face with her hands, and gasped faintly: 'Oh, Smith, Smith! I shall never forgive myself! That poor innocent girl—she never took my ring. It is there!' And so it was; caught in the finger of the kid glove, which the young lady had carelessly drawn off on her return from her walk, and placed in her muff when she went to the piano, where it had remained untouched ever since.

Pleased as she was at the recovery of her valuable trinket, her satisfaction was much alloyed by remembering all the painful circumstances connected with it, especially the mental suffering of the poor young maid-servant who had been so unjustly suspected of having stolen the ring. She and her mother started directly for the home of the girl's widowed mother, and were grieved beyond measure to learn from her that the poor creature had been so overcome by distress of mind that very serious illness had resulted, and the doctor considered her symptoms very unfavourable. The good news brought by her late mistress had fortunately a beneficial effect, in combination with the greatest kindness and attention that could possibly be bestowed on her; and ere many weeks had passed she was perfectly restored to health. The young lady's marriage took place, and in her new home a comfortable situation was found for the girl, whose happiness was still further increased by the appointment of her mother as gatekeeper at the pretty lodge belonging to Hartfield Hall. And so the matter ended to the satisfaction of every one concerned; but it might have been far otherwise, and people should be exceedingly cautious how they make an accusation which they have no means of proving, lest they bring life-long misery upon the accused, and perhaps repentance when too late, upon themselves.

A gentleman was one day working in his garden. A ring was on his finger, set with a single diamond of great price. Suddenly he missed the stone from its place, and began to examine the ground very carefully, in hopes of seeing it sparkling at his feet. He had been pruning and grafting

fruit-trees, and had never left the spot where he was working, so he knew that somewhere within a radius of a few yards the stone must be lying; but though a minute search was made and continued for several days, and the earth carefully sifted, no diamond could be found.

The gentleman had almost forgotten the circumstance of his loss, when one morning, a long time afterwards, he was strolling, cigar in mouth, through the walks of his garden. As he passed a particular spot, he observed that something glittered brightly among the leaves of a pear-tree on the wall. As this occurred each time that he passed, his curiosity was aroused, and he stepped across the border to examine into the cause of the glitter. It was on the clay that had encircled a graft; and picking at the spot with his finger, he extricated a small shining object. It was his lost diamond! In a moment the whole circumstances flashed into his mind, and he remembered that he had grafted several cuttings that day; into one of which the stone had fallen, and had been held there by the tenacious clay, until this morning, when heavy rain having dislodged some particles of its covering, the sun's rays had glanced upon the diamond, and betrayed its hiding-place very luckily to its rightful owner.

At the time of the robbery of the Countess of Dudley's jewel-box at a railway station, a good deal of disapproval was expressed, and we think not without cause, at a reward being offered for their restoration with the promise 'No questions asked' appended to it. It is undoubtedly wrong to come to any compromise of that kind with thieves, as it is only offering an additional inducement to dishonesty, by rendering its commission comparatively safe. We remember, however, an occurrence that took place many years ago, when a similar inducement was held out to the thieves, unsuccessfully as it fell out, but without producing any disapproving comments.

The circumstance to which we allude happened in Edinburgh, to the wife of a physician of eminence at that time. She and her husband went out to dinner at a house situated in one of the 'Terraces,' a rather remote part of the city, where at all hours the traffic was small, and at the hour of a fashionable dinner-party very few persons indeed were likely to be passing. Moreover, it was broad daylight, or very nearly so; and they were driven to the house in their own carriage by a coachman who had been in the doctor's service for twenty years. The lady wore a handsome white lace-shawl; it had been her wedding veil, and she prized it for that circumstance as well as for its intrinsic value. To preserve it from being crushed, it was her habit to put it on the top of her warmer wraps; and on reaching the house where she was going to dine, it was properly adjusted by the waiting-maid. On this particular occasion she quitted the carriage, and walked along the passage to a bedroom on the same floor, where a maid was in waiting to assist her in removing her outer covering.

'Please take the lace-shawl off very carefully,' said the lady.

'Lace-shawl, ma'am?' replied the maid doubtfully. 'I don't see it, ma'am.'

'Yes, the white lace-shawl,' said the lady; then as she stood in front of the mirror she saw no

shawl was there. 'Oh, how stupid! I must have dropped it in the lobby. Look there, if you please.'

The maid did so instantly. No shawl was to be seen. She ran to the front door and looked out. No shawl on the pavement, no person in sight; only the carriage at a considerable distance, too far off for the coachman to hear had they even called after him.

'Oh, never mind,' said the lady; 'it can't be helped now. It must have slipped down on the floor of the carriage, and the coachman will find it when he gets home.' And she and her husband joined the party in the drawing-room, and gave themselves no further concern for the time about the shawl.

Now comes the strange part of the story. The coachman never found the shawl; it had not been left in the carriage, so far as he was aware; but not knowing of any special necessity for examining the interior of the vehicle, he had not done so before again bringing it at night to take home his master and mistress. Nothing, therefore, was heard of the shawl; and a notice of the loss was inserted in the newspapers, with a reward of ten pounds to whomsoever should restore it.

Some weeks passed, but no finder appeared. It seemed certain that the shawl had been stolen, and as the lady was very anxious to regain possession of it, a fresh notice was put into the papers: 'Fifteen pounds reward, and no questions asked.' A tolerably strong inducement to the thief, if such there were, to give back what must have been a very useless acquisition to him; and yet this advertisement met with no greater success than the other.

Weeks rolled on, and changed into months, and eventually years; the lady never more set eyes on her wedding veil, and finally abandoned all expectation of ever again recovering it; and she never has. Now, what became of that shawl!

FOLLOWING UP THE TRACK.

CHAPTER XI.

WHEN the surprise and confusion incident to such an unwonted and irregular episode had partially subsided, the judge, in indignant language, denounced the scandal which had been enacted in a court of justice as more fitting for a theatre, and which no anguish of mind could excuse or even palliate. With some difficulty Stephen Meagher was released from the gripe of Ellen's husband, who was removed in custody for what was regarded as gross contempt; but in the passion of his vengeance, he was unconscious of all other thoughts or feelings than its indulgence.

'Your own proceeding, sir, was, I must say, very extraordinary, assuming the character of a witness rather than that of a counsel,' was the observation from the bench, addressed to Mr Travers. 'It was not justified by anything which was legally in evidence; and from your great experience and judgment, I should have expected no such dramatic exhibition.'

The skilled advocate bit his lips, but repressed the emotions which were agitating him, and then said with fervour, pointing to the money-lender

and publican, who was staring wildly around him, and supporting himself against the ledge of the desk behind which the clerk of the crown was seated: 'It remains for another day to shew whether his hands are not stained with innocent blood. Providence in its own good time will reveal the truth, and either vindicate his innocence of such a crime, or establish his guilt, if he be guilty. But before this tribunal and before the jury, after the exhibition he has made, I arraign the perjured testimony he has given in the face of the country—the attempt he has made to shield the prisoner in the dock by the story as to the possession of the love-token as false as it is incredible, and his attempt also to establish an alibi. And not he alone has been a lying witness; youth itself has been corrupted to serve a purpose.'

Clover, who had been standing in the immediate vicinity of the dock, a very attentive observer of all that had been passing, cast one quick, furtive glance around him, as he heard these latter words, and was then stealthily making his way through the crowd to the door leading into the general passage for the public.

'That had must not go out for the present,' announced the authority in ermine, detecting the movement; 'he may be required during, or possibly after the present trial;' and Clover, seized by two constables, and leaving the court under their unpleasant guardianship, exclaimed in most appealing accents: 'Don't send me to jail, and I'll tell the truth and nothing but the truth. I was put up to swear what I did by my master and the man there;' but his declarations were either not heard or were disregarded.

No further questions were asked, as might be supposed, of Mr Stephen Meagher. He seemed like one in a cataleptic state; he crept along with uncertain steps, and was conducted to a room which opened into a pleasant garden; and in about an hour afterwards the sheriff, accompanied by a magistrate, was seen with him and Clover passing underneath the gloomy gateway of the jail, the latter two kept carefully apart by those who formed their escort.

The trial of the prisoner Brien Spelassy was now resumed, after the eventful incidents that had occurred, and which seemed to impress him with a fear similar to that of his employer. A visible anxiety succeeded to the firm bearing he had previously assumed; and darker and deeper fell the shadows around his path of life, as with a clearness almost amounting to demonstration, Mr Travers dwelt upon and wrought into a chain of continuous strength all the facts which led to but the one result. He professed not to introduce any topics except those strictly relevant; and the jury were therefore, he added, not to prejudice the case of the accused by what had taken place with Meagher, save so far as the alibi sworn to by that man had been incidentally elicited to be a concocted one. It was not now the time or the place to say whether he was one of the

three who had come to the Glen. There was no formal charge against him at present of which they could take cognisance, but it would be afflictation to suppose that what had so recently occurred could be wholly erased from their minds. The marvellous coincidence between the torn portion of the coat and the piece which the bereaved husband retained possession of after his deadly struggle in the bedroom, was a startling fact, but it ought not to press against the prisoner; but on the other hand they would have to consider, was the evidence of the publican and Clover the result of an artful conspiracy, in order that by little specious and, as it were, incidental circumstances, and therefore the more plausible, the crime in which John Dwyer had unquestionably been a participator, should be fixed upon two imaginary strangers, one of them a pretended Spanish sailor, with a peculiar mark upon his face which could leave no doubt as to his supposed identity? This attempt to defeat justice would most likely have proved successful had it not been for the providential incident connected with the false and fabricated copy of an entry that never existed—an entry professing to fix the time, and to record a sale which had never taken place.

When the Chief-justice proceeded to charge the jury, swayed by no feelings but those of right and of truth, it could scarcely be even conjectured what opinion he himself had formed in reference to the guilt or innocence of the accused. After referring to the remarkable testimony as to the possession of the love-token, and its being found in a depository over which the prisoner had exclusive dominion, he warned those on whose fiat depended the issues of life or death, not in any way to be influenced by suspicions arising from the startling charge so irregularly made by the man frenzied with excitement against the employer of Spelassy. It should have no adverse influence as regarded the latter; and the gentlemen he was addressing ought to blot it out of their minds. It was rather a scene to be witnessed on the French stage than one suited for the arena of an unimpassioned tribunal of justice. They should carefully weigh all the evidence at either side, especially that which was given by Meagher, and which if credible, went to shew that the possession of this token by the man at the bar was not a guilty one.

The twelve jurors who had now to fulfil their functions at the close of the trial slowly retired to their room for deliberation; and groups in the crowded court-house proceeded to discuss with lively interest what would be the probable result; and without assuming too much against poor human nature, the same feeling was manifested as by sportsmen who consider a day as lost if the object of their pursuit is not hunted down, be it the timid inoffensive hare, or the crafty and felonious fox.

After an interval of four weary hours, the door of the jury-room opened, and a murmur of 'Hush, hush!' spread like a wavelet to the extremest end of the gallery; but when the members of that body had seated themselves, the foreman, in answer to the question from the clerk of the crown: 'Have you agreed to your verdict?' replied: 'No! Some of the jury wish to have read over to them again the evidence of Maurice Power as to what occurred when he left the public-house in Clonmel, and also

the particulars of his struggle with the men when he rushed into the bedroom of the cottage.'

The requisition was at once of course complied with by the judge, and then they retired; and again, after an interval of about an hour, made their appearance, the issue-paper held in the hand of the foreman. There was profound silence. The prisoner, who in their absence had been taken to a cell removed from the view and gaze of the public, was now placed in front of the dock, and with fearful earnestness fixed his eyes upon the portentous document which had been at this juncture handed down to the proper official. Portentous indeed! One little word included—only three letters—and the freshness of the mountain air through the perfumed heather may blow upon the face of the free man. But no! The three letters are *not* there, and a deep low voice reads the verdict, 'Guilty.' 'Neither the sun nor death can be looked at steadily,' was the saying of a profound thinker, 'even when the last messenger comes to one worn out with long sickness, and with nerves dulled with pain, or inert from the want of vital energy. But what is it when the man is to be stricken down in the full vigour of his physical strength, and with shame and execration as his attendants through the dark valley.' 'Look to him, jailer!' was uttered by the official; and then there came a heavy 'thud,' and within the barred inclosure lay the prostrate and grovelling form of one of Cain's lineal descendants. It was, after all, a cruel kindness of the surgeon who was present to awaken the miserable wretch to consciousness—to bring back the flow of blood from the oppressed brain to the palpitating heart for the forty-eight hours only then allowed from the pronouncement of doom to its execution—to restore consciousness, when forgetfulness and utter oblivion of the present would have been the only boon. But the criminal, after an interval, was rendered sensible of what was passing around, yet only to hear the impressive and now broken voice of authority speaking; a solemn voice, exhorting to repentance of the past, and reminding of the mercy not akin to this world. The time was short, indeed, within which a change was to come over that stolid, degraded being, and then away to a far-distant land through the desert; but amid the gloom and the darkness, the gentle breathings of charity whisper that angels have visited condemned cells, and have brought words of hope and assurance to the worst of criminals.

CHAPTER XII.

In the early year of the present century with which our narrative is conversant, the assizes at Clonmel usually occupied more than a fortnight—the execution of Brien Spelassy was a wonder of the day, and its interest had passed away; but that interest was awakened anew when within the fortnight the money-lender, even changed in aspect within such a short period, and with words his looks belied, pleaded 'Not guilty' to the indictment which charged him with having with others bereft of life, Ellen Power. Public opinion was adverse to the prisoner, public opinion, which is seldom mistaken in the end. It dispenses its praise, but more frequently its censure, with impartiality, whether to the blue-veined aristocrat, or to the drunken coster-monger who kicks

his wife when she asks for a shilling to buy bread for her starving children. Witness after witness came forward when once the clue had been discovered; and Clover, now that there was no object to be attained but his safety, made a 'clean breast of it,' as country-people colloquially express it. His revelation was to the following effect. On the night of the tragedy, Spelassy, his master Stephen Meagher, and John Dwyer—who had been secreted in a loft over the stable of the public-house, to avoid being seen by strangers—left Clonmel at an early hour after dark, taking a circuitous bridle-road, carrying with them firearms, which had been carefully loaded before they started on their journey, and were wrapped round with long 'suggans,' or twisted hay-ropes. He was directed to detain, under any pretext which his ingenuity could suggest, the farmer, when he should call, pursuant to his previous arrangement; and the usurer handed his servant a little phial containing a dark-coloured liquor, which he was to put into the drink of the expected visitor. Clover deposed that he did accordingly administer the draught, which threw its recipient into a profound sleep, and in which state he remained until the house was locked up for the night. He added that at daybreak, or shortly afterwards, the prisoner and Spelassy returned, and shut themselves up in the private room of the former; and the witness being stimulated by curiosity, after a little time crept to the door of the apartment in question, against which he placed a chair, and through a little opening eagerly watched their proceedings. A pile of money was carefully divided on the table into three portions; and after that business had been completed, an animated and angry discussion arose, but carried on in whispered accents, as to what should be done with the third part, for which there was no ostensible representative or owner; but the lad, fearful of being discovered, removed the chair, and quickly withdrew to the bar of the public-house, the glasses in which he was ostensibly busy in cleaning when the two men came out from the room. From that day forth he noticed that no very friendly relations seemed to subsist between Spelassy and his employer. Half-muttered threats were at intervals uttered by the former when drunk made him forget his usual cunning, to the effect that he could reveal something if provoked which would leave the establishment without an owner; but with returning sobriety he always anxiously declared that this was all silly talk, and that the liquor had left him no sense.

The revelations of this witness were of course denounced by the prisoner's counsel as false, and an after-thought; and it was urged very plausibly that no reliance could be placed on the testimony of one who admitted on his cross-examination having so recently, on the previous trial of Spelassy, committed a series of cunningly devised perjuries. But to no such impeachment was the person amenable who next came forward. The honest countenance of Daniel Gleeson was in itself more accrediting than fifty letters-testimonial of character; and in the most natural and quiet but persuasive manner he stated, that after the conviction of Spelassy he by mere chance took up a newspaper containing a report of his trial; for literature did not in any shape, except in ballads sung and sold at fairs, find its way into rural

districts; and farmers busy about their own affairs, were then better pleased to be in happy ignorance of the wrongs they were supposed to be undergoing at the hands of their landlords. The reading of the trial at once brought to his memory what he had seen on All-Hallow Eve. His farm was situated about a mile from the secluded gorge leading from Clonmel to Maurice Power's cottage; he had only very recently become the tenant, and on the night in question he was in his haggard, which abutted on the high-road, armed with a gun, to protect his corn, as he had incurred hostility in that neighbourhood from the mere fact of taking the land from which the former occupier had been dispossessed seven years before. But what are seven years to an Irishman who passes by the place which once was his? His memory remains as green as when first he was driven from its threshold, and his vengeance as fresh as when the door of his cabin was locked by the sheriff and his humble furniture put out on the road-side. While on the watch, Gleeson heard the steps of men approaching from the direction of Clonmel, and he drew himself up quite close to the outer gate; but the strangers passed on, and in the obscurity he could scarcely discover more than that they were three in number. But they had only proceeded a few yards past the gate when a sharp cry of alarm was heard from the party; for a fierce mastiff that the farmer had brought with him into the haggard, dashing through one of the broken bars, was seemingly about to spring upon them. Gleeson quickly followed, in order to draw off the infuriated animal; and in order to effect this, he was obliged to come up quite close to the nearest of the men, and he was about proceeding to offer some words of explanation and regret, when the other ejaculated: 'What do you mean, you scoundrel, by letting the brute loose? I have a great mind to give him the contents of this;' at the same time drawing out a pistol from his pocket as he spoke.

'Did you ever,' asked the counsel, 'see that man since the night you are speaking of?'

'I did, in the jail-yard four days ago, where he was standing with about fifteen more persons; and I knew him at once; and there he is,' accompanying the words by walking up to the front of the dock, and laying his hand upon the head of the usurer, who cowered beneath his touch.

Finally those who were acting for the crown produced the widowed husband; and after his graphic detail of his encounter with the assassin, the coat of the prisoner, with the rent so visible in it near the breast, and the corresponding piece with the button attached, fitting into the vacancy, were subjected to the curious and anxious examination of the jury. The village tailor was scarcely needed to prove, as he did clearly and distinctly, that the coat had been made by him for Meagher, and that the torn bit found in the grasp of Power after his deadly struggle, formed an integral and constituent portion of the dress. The poisoned garment of the athlete of antiquity did not cling to its possessor with more fatal folds than did that of the money-lender to its guilty owner.

The trial concluded, the doom had been pronounced; and fearfully brief indeed was the interval between the sentence and the gathering together of a vast crowd outside the walls of the county jail to witness the last earthly struggle of the condemned. Little time allowed for preparation for the drear

journey to another world; and on this especial morning what a contrast between the face of nature and the judicial tragedy to be enacted! The short but wide street where the last penalty of the law was to be paid was terminated by a passage opening out on the gently flowing waters of the Suir. Banks of the deepest hues of green; trees of every graceful variety of form, through which glancing shadows flitted in erratic play; an islet in the middle distance, half concealing, but only to interest the more, the vision of two silvery sinuous lines, over which hung foliage of almost tropical wealth of verdure; and then far away in the background, the mountains lifting their guardian forms above the sheltered, sunny valleys at their feet, added sublimity to the more gentle attractions of the winding river. There was no sympathy for the condemned man; an unusual circumstance. Had it been a wretched tenant, however improvident or careless, driven from his humble home by greed, caprice, or even in the just exercise of legitimate rights, to find shelter in the ditch by the way-side; had it been one who killed a tithe-proctor when enforcing the rigid decrees of the law; had it been one who, in the heat of blood, avenged a personal wrong or a party feud; or even one who with deliberation and treachery lured an informer to a secret place, and then struck him down—there would have been compassion felt and prayers uttered; the tears of women, and the less developed grief of those of a sterner sex. But for the cold, harsh extortioner, trading on the miseries of others, and who had added a double homicide to the crime of mean plunder—for him there was nothing but the exultation of hatred, or the less active emotion of contempt. Still, when the tolling bell announced the hour of eight o'clock, the whole assemblage, at the instance of the priest, dropped upon their knees, and joined in sincere and reverent supplication to Heaven. Not quite the whole assemblage, for there was one who bent no knee and uttered no prayer—one who, privileged by his wrongs and his misery, had been admitted within the cordon guarded by the soldiery. He stood erect, with riveted eyes watching the moment when he should murmur as he passed on his lonely way: 'Ellen, my darling, and you my poor child, I have had satisfaction for your fate, and hope soon to meet you again.'

It was but a few months after the events last recorded, when, in the hospital of the County Tipperary, the resident physician whispered to the nurse who had volunteered her services, and whose youthful, expressive face appeared prematurely aged by attendance on scenes of affliction and of suffering: 'He cannot, poor fellow, last beyond the night.' These few significant words made more rigid the countenance of her to whom they were addressed. The approach of death often quickens the faculties, as if to shew the supremacy of the immortal spirit over its frail depository, and either the sick man overheard the words, or guessed their import from the manner of the speaker, and a gleam of pleasure crossed his haggard and wasted features. 'I am glad of it,' he gasped out with difficulty; 'there is no one I would live for, and I feel that I am going home.' 'You must not speak so sadly,' observed the attendant; 'it is sinful to wish to depart before

the time which God has given you, and life ought to be dear to all of us.'

'It should indeed,' was the response. 'And what curse ought to fall on those who took away what they could not give? I thought so once; but better notions now come into my mind; and I could forgive even those who made me what I am, if they were still living!'

As if agitated by some fearful emotion at the recollection of the past, the patient sought to raise himself from the pillow, but fell back helplessly, and one or two suppressed sobs evidenced the consciousness of his physical weakness. A long interval, and not a word was spoken, while the clock in the corridor ticked and recorded the minutes with what seemed a callous persistency of purpose, indifferent to the events which a few revolutions of the index-hand might record. But then came disjointed utterances in the pauses between physical suffering and weakness: 'I did not, I could not know he was there. I broke her heart, no doubt; but was I to blame for it? Why did he mix himself up with the villains in their unholy work?' The speaker closed his eyes, ostensibly to remove away from him some terrible presence, and it seemed as if the last breath was passing away into the silence of the grave. Hot, scalding tears fell upon his face -- the bending form of the faithful attendant was over the fever-stricken man. One final effort, and half lifting up his emaciated form, Maurice Power exclaimed: 'I know now I am not dreaming! It can be no one else than Mary! Oh! Mary Dwyer, forgive me the wrong which I did you, but it was unknown to myself at the time!' After these few words were uttered, there was an ominous silence for a minute or more, while the last throes of life were breaking in broken sounds upon the shore of time, and then came the impassioned response: 'I do indeed, from my heart of hearts!' Death and its 'counterfeit presentment' were at that awful instant associated. The physician closed the eyelids of the dead; and Mary Dwyer lay insensible upon the body as the pledge of her Christian faith and forgiveness was still quivering upon her lips.

'The old, old fashion,' says a great one, who himself has passed away; 'the fashion that came in with our first garments, and will last unchanged until our race has lost its course, and the wide firmament is rolled up like a scroll. The old, old fashion! Death!'

Here our story is ended.

USEFUL ITEMS FROM FRANCE.

MUCH as we dread the pinching frosts and biting winds that check the sprouting wheat and nip the tender blossoms of our fruit-trees in their first flush of promise, our neighbours on the sunnier side of the Channel have still more reason to dislike a chilly and backward spring. French agriculture in many provinces partakes of the character of gardening, and vines and olives and madder and white mulberry, to say nothing about almond and orange trees, are of delicate constitution. One sharp night, one bitter dawn, when the hoar-frost glitters on the grass, may convert the competence of the husbandman into comparative poverty. The

drier atmosphere and hotter sun of France, as of most continental countries, tend to produce such nightly frosts, from which the natural moisture of our own climate preserves us, with destructive frequency. M. Pinard, a wine-grower of inventive disposition, last year applied himself successfully to remedy this evil, and to guard his vineyard against the periodical raids of Jack Frost. He conceived the bold idea that artificial clouds, capable of moderating the excessive radiation of heat from the earth skywards, might be formed. Two crucial conditions had to be faced. M. Pinard's clouds must be cheap, and they must be at hand when wanted. Mixing coal-tar with wetted chaff and sawdust, so as to form huge balls, ready, when ignited, to darken the sky, he placed these on the ground at selected spots. Each lump contained two gallons of tar, calculated to burn, in calm weather, for three hours and a half. By an ingenious device, the thermometer, in sinking to within two degrees of the centigrade zero, communicates the tidings by electric telegraph to the sleeping vine-dresser, so that the advancing enemy Frost is actually made to ring the alarm-bell that gives warning of his approach. The labourers sally out to kindle the tar-beacons, and the peril is averted.

M. Tellier's fire-extinguisher, for the salvage of burning ships at sea, is of the simplest nature, demanding no outlay save for a couple of large pans of sheet-iron, some raw sulphur, and an auger wherewith to bore holes in the bulk-heads and lower decks, to admit the passage of the heavy sulphurous gas that will result from the combustion of the sulphur, displacing atmospheric air as it rolls its weighty volume through the hold and cabins, absorbing oxygen, and choking the flames. Thirty pounds-weight of sulphur would yield gas enough to stifle a conflagration below decks in the largest ship, and ventilation will presently get rid of the vitiated atmosphere.

A means of applying strong heat on a small scale cheaply and conveniently is welcome in many trades and by many experimentalists. M. Quichenot's Lamp-furnace, which comprises a blow-pipe, and which does its work by the help of petroleum, may be useful to those who do not employ gas for heating purposes. Strictly speaking, it is the vapour of petroleum, mixed with heated air, which yields the source of heat, the intensity of which may be judged of by the fact that this small apparatus can in ten minutes fuse four ounces of pure copper or nickel, and about three ounces of malleable iron. For soldering, this blow-pipe is well adapted.

To press the sun into the direct service of mankind, and to make his rays heat a steam-engine, seem tasks rather worthy of a Laputan philosopher than of a practical man of the hard-headed nineteenth century. Yet M. Mouchot, a schoolmaster at Tours, has after ten years of patient study patented an engine which is driven by steam, the water in the boiler being heated by no fuel, but by solar rays alone. The boiler, which is blackened, receives the concentrated heat flung upon it by a large metallic mirror, a

great bell-glass covering the boiler and preventing the escape of the solar heat otherwise than as 'dark rays,' while separate mechanism keeps the apparatus in its true axis towards the sun. The machine works, slowly indeed, but steadily and economically, acting at the same time as an excellent medium for distilling water, for cooking vegetables, and for similar uses. It is considered as especially suitable for countries where, as in Algeria or India, fuel is dear and the sun hot and generally perceptible.

The well-known phenomenon of the philosophical candle has suggested to M. Kastner a sort of musical instrument to which he gives the name of a pyrophone, and which consists of numerous short jets of hydrogen gas, or even of coal gas, ignited. The vibration of the air, as countless tiny detonations occur, accounts for these sounds, which resemble those of a flute, and can be modulated at pleasure.

A new and powerful light available for photographers, has lately been devised. That sulphuret of carbon will burn brilliantly is a fact that has been known since the first discovery of the compound, but until lately no one ever dreamed of impressing so volatile a liquid into doing duty as lamp-oil. This has been done with success, but the vapour requires to be handled cautiously. It is absorbed by a number of pieces of porous pumice-stone in the centre of the apparatus, and there made to combine with a gas known as the binoxide of nitrogen, and easy to procure when iron is immersed in nitro-sulphuric acid. The dazzling jet of flame, nine inches high, which this lamp yields surpasses the effects produced by all artificial lights hitherto known. It is twice as efficacious as the lime-light, three times as potent as the electric light, and distances, though at a less interval, that of the magnesium wire. It also receives deserved praise as being steady, cheap, and not very fatiguing to the eyes.

The French Aerial Navigation Society does its best, like similar Gallic scientific associations, to stimulate inventors, but as yet it is compelled to admit that practice lags woefully in the wake of theory. M. Penand has indeed within the last few months exhibited a tiny model of a flying-machine, which raised itself by the force of a screw-propeller to the ceiling of the lofty hall in which the Society met, and also an artificial bird which rose on flapping wings above the heads of the spectators. Light models of a similar kind have, however, been made at various times and in more than one country during the last fifty years; and it is plain that aërostation has, we fear, a dreary future, as it awaits the discoverer who shall give us a new source of motive-power, light, safe, and constant, to do for us what wings do for the bird and the insect.

The preserving of perishable articles of food attracts every year more and more attention, since the perpetual rise in prices renders the populous countries of Western Europe increasingly dependent on distant lands for their supply. We have to draw milk from Switzerland, eggs from Ireland and France, grain from Russia, and not merely meat, but fruit, cheese, and other farm-produce from America. Condensed oxygen is the latest French, as washed or filtered air is the latest British, contribution to the existing knowledge on this point. In oxygen strongly compressed, fer-

mentation it appears cannot take place, and vegetable or animal matter may therefore be thus retained in a condition perfectly sweet and wholesome for an indefinite period.

SIR JOHN SUCKLING'S CAMPAIGNE.

Sir John Suckling, a poet of the earlier part of the seventeenth century, possessed a playful fancy and polished wit. His knowledge of life and society, according to the *Cyclopædia of English Literature*, enabled him to give interest to trifles, and to clothe familiar thoughts in the garb of poetry. Emancipated while yet a youth from all restraint, and possessed of a large fortune, Suckling set off on his travels. He was an adventurous spirit; and when Charles I. took up arms against the Parliament, Suckling presented the king with a hundred horse-men. This troop formed part of the cavalry commanded by Lord Holland; but no sooner had they come in sight of the Scots army at Dunse than they retired and fled—Suckling amongst the routed. A rival wit and poet, Sir JOHN MEXNIS, indited a ballad on the retreat at Dunse, which has been considered to be one of the liveliest and most successful of political ballads.

Sir JOHN he got him an ambling nag,
To Scotland for to ride-a,
With a hundred horse-mo', all his own also,
To guard him on every side-a.

No errant-knight ever went to fight
With halfo so gay a bravado,
Had you seen but his look, you'd have said on a look
He'd have conquered a whole armada.

The ladies ran all to the windows to see
So gallant and warlike a sight-a,
And as he passed by, they began to cry:
'Sir John, why will you go fight-a.'

But he, like a cruel knight, spurred on;
His heart would not relent-a,
For, till he came there, what had he to fear?
Or why should he repent-a.

The king (God bless him!) had singular hopes
Of him and all his troop-a:
The borderers they, as they met him on the way,
For joy did holla and whoop-a.

None liked him so well as his own colonell,
Who took him for John de Weart-a;
But when there were shows of gunning and blows,
My gallant was nothing so port-a.

For when the Scots army came within sight,
And all prepared to fight-a,
He ran to his tent; they asked what he meant;
He said he could not go right-a.

The colonell sent for him back agen,
To quarter him in the van-a,
But Sir John did declare he would not come there,
To be killed the very first man-a.

* * * * *
But now there is peace, he's returned to increase
His money, which lately he spent-a;
But his lost honour must lie still in the dust;
At Berwick away it all went-a.

LOST STARS.

THERE are many otherwise well-informed folks who positively believe, when they see a 'shooting-star,' that one of the real stars has quitted its place, lost its position, and that the heavenly host is left smaller by one than it was before. Of course it is no such thing, the so-called shooting-stars, or meteors, being comparatively mere sparks of matter close to the earth, sometimes flying through its very atmosphere in thousands, and having nothing whatever to do with the stellar orbs, calm in the isolated grandeur of their almost infinite distance from our earth, and moon, and sun, and all the planetary system together.

Similarly placed again in principle, though differently in degree of error, are others who, looking through powerful telescopes to sharpen their gaze, and profiting by the accumulated results of action through many hours, or even days, declare that they have thereby found a 'moving star;' that is, a star with a real motion of its own, independent of the apparent motions given to all the stars by the rotation of the earth on its axis and its revolution round the sun. Such conclusion, the telescopic aid notwithstanding, is still an utter error; for though the object may be ever so star-like, even under high magnifying power, the observed motion, when sensible in the course of a few hours or days, shews that it must appertain to something far nearer to us than any of the stars; and further observations invariably end in shewing the wanderer to be a planet, or planetoid (a little planet), or perhaps the nucleus of a tailless comet of our own solar family; all of them belonging to the same domestic system; within our home-circle as it were, in comparison with the almost immeasurable distance of the *stars* proper.

Before then any one raises the cry that a *star* has been *lost*, let him be sure that it was a star which he saw, before it was lost; and this simple rule of genuine, undeniable common-sense will be found in its application to produce a wonderful clearing off amongst the largest number of such reputed cases.

But how is one to judge if an apparent star is a real star? Something in this way: you may be sure that a stellar-looking object is a star if it is at the distance of the stars; for nothing else than a star, or distant sun, can be seen at such an enormous interval of space; and that any object is at such a distance, is testified by its preserving a fixity in its apparent position among the other stars, day after day and month after month. Not an absolute fixity indeed, but something so microscopically near it, that the true stars are well, as a first approximation, called 'fixed stars;' for so they remain apparently in spite of tremendous natural agencies always at work, and which would find out any deception immediately. Thus the annual motion of our earth round the sun gives us, at six months' intervals, two observing points a hundred and eighty-four millions of miles apart; and an object must be removed far indeed if its apparent direction is not sensibly changed by being viewed from either end of such a base-line as that! And yet the directions of the true stars are not sensibly altered by it. Of a few of them indeed, the nearest of them, astronomers may make out an infinitesimally small change of place from that cause, amounting to about a fine hair-breadth in a large telescope; but with all the greater multitude of the heavenly host, the change is entirely and absolutely inappreciable to man.

Again, our sun is in motion through space carrying all the planets with him at the rate of about a hundred and seventy millions of miles a year; and yet beyond a hair-breadth effect on a very few of them, all the other stars are seen year after year in exactly the same directions. And still again some of the stars have been proved by the new spectrum analysis to be advancing towards or receding from the earth at the rate of ten, twenty, or thirty miles per second of time; and if the object was at any moderate distance, would not such a rate of motion as that very soon alter its apparent brightness or size to us? Most certainly it would; but yet the whole distances of the stars from our sun are such, that though the motion at that number of

miles per every second of time has been going on more or less, ever since the earliest epochs of astronomical observation, no appreciable effect from that cause on the brightness to us of any of the stars concerned, has yet been made out.

Such then is the overwhelming distance of our sun from any star, and generally of any true star from every other true star. Each of them so distant from its nearest neighbour as to appear from thence an almost vanishing speck of light, and yet existing in majestic grandeur and brilliancy surpassing imagination in its own locality; one of them, Sirius, having been proved to give out as much light as sixty-three of our suns; and we know what Sol can do at our terrestrial distance of ninety-two millions of miles. Some too, if not all of the stars are further accompanied by their own systems of planets, many of them far larger than our earth; and if we may judge by what is burning, or rather rendered incandescent in the photospheres of their suns, furnished with untold wealth of gold, silver, iron, calcium, magnesium, and almost every other known metal. One of these mighty though distant orbs then is a true star, and no one can be found fault with for calling it a star; but has such a stupendous amount of mass, matter, light, energy, and glory ever been really lost; and does its former place consequently know it now no more?

'Yes,' answers with the utmost confidence a young scientist of the day; 'often, often! Many of them have been lost, and are lost to this very hour.'

Here is rather a startling assertion to be met with. But on proof being quietly asked for, it is stated by the asserter and his friends that divers and sundry stars observed by former astronomers, and entered by them very accurately in their long since published *Catalogues of Stars*, are no longer to be found in the heavens; for when the places assigned in such a Catalogue are now recovered by instrumental measurement, they are found to be absolutely and perfectly vacant.

This last part of the tale is true enough; but what is the testimony that the Catalogue places ever were occupied? Never is it a case of a star so large and bright and permanent in our heavens as to have been seen generation after generation by lord and peasant alike; seldom a case where even two or three telescopic observers agree to having noted its actual and separate existence among the crowds of similar small stars amenable only to telescopic vision; but in place of such witness there is merely a simple *numerical* entry of the measured place of an alleged small star in the Catalogue, containing the similar places of several thousand stars, by some astronomer of repute in his own day, but now no more. To what extent then are we to rely upon that?

Even granting that such astronomer has not -- though most of them have, when observing in a wholesale, manufacturing sort of way large numbers of small telescopic stars -- catalogued inadvertently as a star some faint planet, or planetoid then unknown (such as either Uranus or Neptune, or some one or other of the hundred and sixty-seven planetoids between the orbits of Mars and Jupiter, now known to be circling for ever through the heavens, and any one of whose then places is of course vacant now); have his observations been always computed correctly to obtain their final results,

and have these been printed also without typographical error?

When Sir William Herschel in the last century examined the heavens, with the celestial atlas and stellar Catalogue of Flamsteed, the first British Astronomer-royal, in his hand, he found so many of the stars marked there to be missing in the sky, that a laborious reference was made to the manuscripts of Flamsteed's original observations; and no fewer than a hundred and eleven cases were thereby discovered of imaginary stars, caused by errors of transcribing, calculating, or printing; while from five hundred to six hundred real stars accurately observed, had been omitted! Flamsteed himself, we should say in justice to him, did not live to calculate and print his own observations; but other astronomers, and careful literary compilers, and even societies of the best scientific men of the day, can seldom produce anything extensive without error somewhere or other. Hence, when the late Captain W. S. Jacob of the Madras Observatory sent a paper to the Royal Society of Edinburgh in 1851 describing his examination of one thousand four hundred and forty star-places selected from the supposed accurate Catalogue of the British Association for the Advancement of Science, published only fifteen years before, he shewed that he had discovered discrepancies between the position of many of the catalogued stars and their exact positions in the heavens; and that there were no less than forty-three of the objects numbered in the Catalogue of which he could find no trace whatever, even in the clear and transparent air of India.

Were those then really lost stars? The newspaper reporters present at the meeting seemed to think so; and their abstracts next morning evidently spread the idea. And the author of this paper was asked by some -- in furtherance of prophetic studies concerning the last days -- whether it was really true that forty-three stars had actually disappeared from the firmament of heaven in the course of the last fifteen years only!

'I did not say *stars*,' replied Captain Jacob; 'I took very good care to say *numbers*; such and such numbers in the list of the British Association's Catalogue. Those numbers ought, no doubt, each of them to represent or designate a star; but there is no positive security that they do, gathered as they have been from all sorts of sources, until they have been examined, re-examined, and certified by subsequent and most thoroughly independent observers; and if the British Association for the Advancement of Science desires to maintain its ancient unexceptionable fame, rather than its present specious popularity, the sooner it curtails its dinners, and spends the proceeds on preparing a new edition of its Catalogue of Stars, the better.'

Well! but for all that, urges one of the new school, there are cases of real stars certainly known to have existed once, and as certainly known not to be visible now, such as the following example, extracted from Arago's *Astronomy*: 'The fifty-fifth star of Hercules, placed in the neck of the figure, has been inserted in the Catalogue of Flamsteed as a star of the fifth magnitude. On the 10th of October 1781, Sir William Herschel saw it distinctly, and noted that it was red. On the 11th of April 1782, he perceived it again, and inscribed it in his journal as an ordinary star. On the 24th of March 1791, there no longer remained any trace of it. Repeated attempts on the 25th and on

subsequent occasions led to no other result. Thus the fifty-fifth of Hercules has disappeared.' All this account may be accepted freely as describing correctly what was seen at the dates of observation concerned; and as there are probably not a few more so-called lost stars, yet no more necessarily or actually lost than this one, let us explain what its position is now generally considered to be.

Fitsful changes of colour and specially red scintillations have been long remarked as highly characteristic of an extensive and well-known class of stars termed 'variable stars,' or stars variable in their brightness and consequent visibility through periods of time, extending in the different cases from a few days to many years, and occasionally it is believed to several centuries. Thus the star termed by astronomers Algol or β Persei, varies in brightness from the second to the fourth magnitude, and back again, in the short period of two days twenty hours and forty-eight minutes. β Lyra varies from the third to the fifth magnitude and comes back to the third again in six days nine hours. Omicron, or Mira Ceti, varies from the second magnitude to complete invisibility and reappears and comes up to the second magnitude again in three hundred and thirty-four days. α Argus varies from one of the very brightest of the stars of the first magnitude in the whole heavens down to a most inconsiderable one of the fourth magnitude, and blazes out again up to the first magnitude in about forty-six years; while R Cephei varies from the fifth magnitude down to the eleventh magnitude, or visible only in a very powerful telescope, and returns to the fifth (which is visible to the naked eye) in about seventy-three years.

Now these stars, no matter how much they may vary in brightness, are no more lost and perished in space when they fade away and disappear to us, than our sun is when hid from our view at night by the intercepting body of the earth. Neither are they moved out of their fixity of place, nor deprived of any of their mass and gravitation governing power over their attendant planets, any more than our sun is, when at times, now known to be periodic and subject to law, his bright surface is dimmed by many dark spots. Hence the simplest supposition to explain the observed phenomena of the star fifty-fifth of Hercules is, that it is one of those 'variable stars.' In which case it still undoubtedly exists in its own place, and will again appear to view there at some future time.

But mere telescopic details can affect only the few; while the general public is rather thirsting for a case of some good big star, which all can see. 'Was there not such a star' they ask, 'brighter than any of the orbs we have before us now, to be seen once in the constellation of *Cassiopeia*; and did it not burn and blaze through several years in varied colour, just like a world on fire, and then disappear and leave its place absolutely vacant?' Such a star was certainly seen by all the northern world in 1572, 1573, and 1574, but not previously to that; until, at least, you ascend the stream of time to 1264, when a temporary apparition of the same sort appeared in the same part of the sky; and again the same thing is reported in history to have occurred about the year 945 A.D. So that here again we have merely an extreme case of a 'variable' star, with an intense though short-lived *maximum* of light and a long-continued

minimum. But so far from being now—because its *minimum* is below human visibility—a lost, lapsed, or destroyed star, it may be and probably is, going on in its own place according to laws which it has followed in the past, and will continue to follow for countless millions of years, without a moment's cessation at any time. And in fact the sequence of the numbers 945, 1264, 1572 lead astronomers to expect its reappearance at some time previous to 1890. And if it does shine forth again at that time, and prove itself in the scientific age of the world to be 'a variable' with a period of more than three hundred years, it will not only get the physical nature of its light well examined by spectroscopic analysis, but will strengthen that 'variable-star explanation' for the benefit of many other temporary stars with still longer periods of time; and longer, we say advisedly, because only one of their maxima of brightness is known to have been witnessed yet through all the human period.

Such were the intensely bright star in Serpentarius in 1604 A.D.; the bright star in Scorpio in 900 A.D.; another in Aquila in 388 A.D.; and another still in 130 A.D.; not to say anything of the still more celebrated and classic case of the 'Lost Pleiad,' which the poets affirmed to have disappeared in grief after the siege and taking of Troy about 1200 B.C., leaving thereby the primeval group of 'the seven stars' to be six only, ever since; but with the asserted destiny of the seventh one shining forth at some future time brighter than ever. A sort of early poetical prophecy, which the recent progress of practical astronomy on one side and archaeological research on the other, especially at the Great Pyramid, have been lending remarkable confirmation to within the last very few years.

FALLEN FORTUNES.

CHAPTER III.—HOW THEY LIVED EVER AFTERWARDS.

JEFF crumpled the newspaper into his pocket, and walked back in haste to the house he had just quitted. He would tell the news at once to Mr Dalton, and then Kate would receive it, as it should be told, from her father's lips. He knew Dalton's nature too well to fear that he would feel or express any cruel exultation at the death of his enemy; but he was not prepared for the grave solemnity with which he received the intelligence.

'I have news, which I am sure you will both deem sad news,' said Jeff as he closed the parlour door behind him: 'Mr Holt is dead. He shot himself this afternoon in his office in Abdlle Court.'

'I am not surprised,' said Philip coolly; 'he was not a man to live disgraced.'

Dalton said nothing for a minute or so. It was not mere pity that made him speechless; it was something more—a certain sympathy. His memory was recalling that scene on Bleabarrow crags when he himself had been about to appear unsummoned in the presence of his Maker. 'Heaven have mercy on him, and forgive him, as I do!' were his first words.

'Poor fellow!' said Philip, by way of epitaph, and as though the subject in its sentimental aspect were thereby dismissed and done with. 'I hope we

shall have no trouble in consequence of this, about the shares and things.'

'He said he "had much business of a private nature to arrange,"' said Jeff, 'when I parted from him; and he had few hours of life before him then: I feel confident that they were spent in reparation.'

'Let us hope for the best,' said Philip; which, let us imagine, was a pious wish with regard to the dead man's future.

Then the two men began to talk, in quite a different manner than that they would have used half an hour before, of Holt's character. They both agreed that he was an excellent man of business: keen, diligent, and firm as a rock in a storm.

'If he had cared for anybody but himself, he might have been a happy man,' said Dalton's verdict.

'You are wrong there, Mr Dalton,' said Jeff confidently. 'He cared for Kitty.'

'Hang his impudence!' said Philip. 'Mind, I didn't say *hang him*.'

Dalton frowned a little, but made no observation on the subject.

'Come,' said he presently; 'let us go up-stairs, and break it to the girls.'

'If you will excuse me,' said Jeff; 'I would rather not see them again to-night.'

'As you please, my lad,' returned Dalton. 'You had better look in at our place the first thing to-morrow morning. Come and breakfast with us, and then we can talk matters over.'

Jeff accordingly went home at once, feeling that he had quite enough to think about, but only to find there more material for thought. At his lodgings he found a visitor who, his landlady informed him, had been awaiting his arrival there for hours: a certain Mr Strelham, with whom, as Mr Holt's confidential legal adviser, he had some slight acquaintance.

'You are surprised to see *me* here, no doubt, Mr Derwent?' said this gentleman, in a tone which Jeff could not but consider was under the circumstances somewhat jaunty and indifferent.

'No, sir; I am not surprised,' returned he stiffly, 'since I already know what has happened.'

'Indeed! Why, Mr Holt led me to understand that his intentions had not been disclosed to anybody. He sent me here with a most express injunction to see you to-night and communicate them.'

'His intentions, sir? You cannot surely be referring to his design of committing suicide? Are you aware that he has blown his brains out?'

'Bless my soul!' cried the attorney, startled into devoutness. 'You don't say so! Blown his brains out! and such clever brains too! Well, that explains the whole affair, then, which up to this moment has been so inexplicable to me. He has made over all his property by a deed of gift. If he had left it by will, and then put an end to his life, don't you see there would have been a difficulty about the matter? As it is, everything is quite simple. Even a verdict of *felo de se*—if a jury could be got to find it—would not affect the disposition of his money.'

'I hope it has been so disposed, however, Mr Strelham, independently of this deed of gift, that he has made restitution?'

'Yes, yes; we need not talk about that now. I guessed, of course, that there was something wrong—it was about that *Lara mine*, was it not? That

money—every shilling of it—has all been paid, or is in course of payment.'

'I am most sincerely pleased to hear it,' said Jeff, with a sigh of relief. 'It must be owned that he did what he could at last to put himself right with his fellow-men.'

'Yes; and also to reward his friends,' remarked Mr Strelham with significance.

'Indeed,' answered Jeff indifferently. 'I was quite unacquainted with them; I knew nothing of his social relations.'

'I don't know that he ever had any, except with Mr Dalton, with whom it appears he has had disagreements. He has made over the whole of his property—something over fifty thousand pounds, I should say at a rough guess—to one Geoffrey Derwent.'

'Left it to me!' exclaimed Jeff, astounded.

'O yes; there is no mistake about that. I was to remind you that he said you would have no reason to repent having shaken hands with him. I don't shake hands myself in a general way—I don't think it professional; but if I had thought my late client was so gratified by the ceremony, I would never have omitted it.'

Jeff did not hear the pleasantry; his mind was occupied, not with his own accession to wealth, but with the difference of position in which it would place him as respected Kitty. Gratitude to the dead man, and gratitude also to Dalton, who had accepted him as his son-in-law without a penny, were contending in his heart. The former he could never repay; yet, strange to say, it affected him less of the two. It is the bane of the base that even their very gifts lack the savour of giving; moreover, it must be remembered that Holt, having no further use for his money, must needs have given it to somebody. Afterwards, when Jeff came to think upon the matter, he felt the dead man's generosity more keenly, and acknowledged it in heartier fashion; for the conviction was borne in upon him—and it was no doubt a just one—that this vast fortune, given to himself, was, in fact, only given to him in trust to Kitty, who, as Holt had reflected, might have refused to accept it more directly.

On calling at Dalton's lodgings the next morning he found that Mr Strelham had not exaggerated the completeness of his late client's settlement of all claims on his estate.

It appeared afterwards that throughout the progress of his funds as respected Dalton, he had kept the most accurate debtor and creditor account of matters, and was thus enabled to repay every shilling—both principal and interest—in which he was indebted to him.

'If he could cook accounts, it must be owned,' as Dalton observed afterwards, when the matter had grown familiar, 'he could also keep them.' He was indeed, in spite of a few grains of honest sentiment, a great financier, and admirably fitted to control the destinies of a joint-stock company or a foreign loan.

Kitty, I think, held another view of him, which—since he was dead and gone—almost took the form of tenderness. She understood the man, as regarded his affections, as only a woman could have done. She knew that when he had persecuted her most he had loved her as few men can love; and now that he had become a mere memory, and she could, as it were, afford to do so, she in a manner respected him.

Even Jenny in days to come had a certain qualified praise for Mr Holt, with whom she would frankly confess she 'had had no patience until he left dear Jeff all that money.' She thought there was more real good in him—if 'grit' be good—than in such fair-weather friends as the Skiptons had proved themselves to be. She deemed him 'worth a dozen' of such as Mrs Campden; but then, in Jenny's estimation, a dozen Mrs Campdens were, to use a phrase of the auction-room, a very 'cheap lot' indeed. He was a rogue, but at least he did not mingle his roguery with cant and 'gush' and protestations of 'eternal friendship.' These remarks, of course, are, however, like a Reuter's telegram, 'in anticipation of our usual advices.'

It may be easily imagined that as even Kitty's tender conscience had had little to urge against her union with Jeff as matters had stood, she saw no obstacle to her own happiness, now that the other claimant for her hand had removed himself from the field; while whatever 'people' might have 'said' had the wedding taken place under other circumstances, they had now nothing but congratulations to offer upon the union between two young persons, not only so obviously fitted for one another, but whose means were so proportionate. It was every way a most 'desirable' match; and was ever anything so 'funny' as that father-in-law and son-in-law should possess the same diamond mine (or something) in Golconda (or somewhere) together! The whole thing seemed so 'providential,' and as though it had been 'preordained,' as it were, you know.

Dalton went about saying the bitterest things against Society—and yet mixing in it almost as much as he had been wont to do. His smile was less genial, but his wit was even keener than of old. He was quite as much sought after as before, but not so well liked. It was complained of him by a great lady of fashion that Mr Dalton would say 'quite horrid things' at times; by which it may be presumed her ladyship meant the naked truth. The fact was Dalton was like a fish out of water among plain honest people, such as have no turn for epigram, who are content to keep their claret till the second day, and who use ready-made 'dressing' for their salads. He knew that there were other atmospheres purer and more wholesome, and was angry with himself because he could not live in them; or at least that they did not suit him. It is the fashion to say that adversity does us all good; but if it be so, John Dalton was an exception. His wife's death was a terrible loss to him. Doubtless such pure souls are well employed to whatever scenes of bliss they wing their flight; but to the post of guardian angel to her husband, which she had filled in this world to such perfection, there was no successor, and he missed her gracious influence sorely.

It must be said, however, to his credit, that notwithstanding her vacant chair at his fireside remained unoccupied, the sweet influences of home never lost their power over John Dalton.

After a sojourn at the seaside, which placed poor Jenny at as good a stand-point in regard to health as she had ever been, he took the family to the old home in London which their mother's memory had made so dear, and where a charming surprise awaited them. Every article of furniture that could be recovered from the purchasers at the sale was found there in its old place; and the same

welcome and familiar faces greeted them, from whom their father's Fallen Fortunes had at one time compelled him to part.

The mistress of all indeed was absent; but another member of the family was installed there *en permanence* in the person of Uncle Philip.

Society, with her fine perception of what is right, expressed herself as astonished and even 'pained' to perceive the landmarks of legitimacy thus ignored; but she was not absolutely 'outraged,' as she would have been had the *Quito* proved less remunerative. She contented herself with hinting that Mr Dalton had doubtless his reasons for so singular a proceeding; and that if everybody had their rights, perhaps it would be found that the case of Astor *versus* Dalton had been decided wrongfully. The report was, that Philip had his home and his income upon the understanding that he did not marry, whereby complications might arise to give employment to gentlemen of the long robe in the second generation. The rumour received this much corroboration, that Philip remained a bachelor.

Jeff carried away his bride from her new old home at midsummer, but settled so near it, that Jenny and she were scarcely more apart than when they lived under the same roof. Her baby brother continued to be her especial charge and idol long after she had children of her own; and when many years after he followed his brother Tony's example and became an Eton boy, he received every 'half' such hampers from Sister Kitty as put to shame even the liberal contributions from his own home.

On the other hand, Tony and Jenny are as fast friends as ever; and though the former took a creditable degree at Cambridge, he has been heard to say in the Society of Lincoln's Inn that all that now remains to him in the way of learning which is worth a shilling was taught him by his second sister.

The chief guest at Kitty's wedding was Dr Curzon; and I am afraid that the names of the company did not occupy a very long paragraph in the *Morning Post*. There were plenty of fine people who would have been glad to come, and I think Dalton would by that time have so far forgiven his fellow-creatures as to invite them; but Kitty said: 'No; if you please, papa; I would rather have only real friends at my wedding.'

It was very seldom she expressed herself with such decision, yet somehow her husband was guided by her in most things. 'She has a very light hand,' Dalton used to say, 'and Jeff has a tender mouth.' Above all things, Kitty had a horror of 'the City' and speculation of all kinds; and since it would never have done for Jeff to be idle, she sent him into parliament, where he was greatly liked. Though not distinguished for oratory, he spoke now and then sensibly enough; his opinion upon commercial matters had some weight—at all events in the smoking-room. It was generally supposed there that he had been in early life 'largely connected' with the City. Very few people know more of other people's early lives. Curiously enough, it was never whispered that he had been connected with literature. 'His good manners,' Dalton said, 'forbade the suspicion.'

Jenny made quite a success as an authoress; only her views were 'dreadfully advanced,' folks said, and her observations 'really, you know, so very severe.' However, she put her principles, whatever

they were, into practice, and aided with purse as well as pen every genuine scheme of philanthropy if it only kept itself clear of patrons. She did not like patronage even for other people, and as for herself it was dangerous to offer it. A benevolent duchess who met Jenny on a Board once attempted it with her, and is said to have been greatly discomfited. Dalton's version of his daughter's retort was that, shaking her curls and shewing her teeth at Her Grace like a Blenheim spaniel, she had said: 'Ma'am, don't patronise me, or I'll bite.'

I am afraid Jenny has never forgiven Society for its behaviour to her and hers, when they 'went under'; but on the other hand she does her best to help and comfort those who are in the same sad plight: for as to turning *her* back upon a friend—she would as soon think of enlisting in the Horse Guards. She was steadfast in all things, and from one resolution nothing moved her—namely, that she would never speak to Mrs Campden. But for her perhaps, some sort of reconciliation would have been patched up; as it was, the two families never renewed their former intimacy. Mrs Campden died in a few years of a cold, said the county paper, caught in distributing tracts to 'her poor people, by whom she was greatly revered'; but strange to say her loss brought Uncle George no nearer to his old friends the Daltons. He knew that they harboured a bad opinion of his Julia, and a certain chivalry of disposition forbade him to make advances to them.

In after-years indeed, Jeff and Kitty, with a whole tribe of pretty children, passed a summer month at Riverside; but the old geniality was wanting; Mr Campden felt there was a subject, sealed, between them, yet one to which it was difficult not to make allusion.

He knew his wife had behaved ill, of course; but he made excuses for her—such as we know nothing about. Women, as everybody knows, will cling to their husbands, be they ever such scoundrels; and men will cling—though not so often—to wives who are mean and base, and make allowances for them such as astound the looker-on.

Upon Jenny Dalton, it was generally imagined that the plough of Adversity had made deep furrows; while her sister had remained unscathed, or that the marks of that rude discipline had soon worn away. But I venture to think that judgment was a superficial one. Kitty, like her mother, was a favourite in society, but—like her—the roots of all her happiness lay deep down in the garden-ground of Home. She forgave the world; but in her heart she never forgot its sorry treatment: she was gracious in return for its civilities; but she knew their value, and was not to be (twice) deceived.

Strange to say, her father, as I have hinted, was much more easily reconciled to his fair-weather friends, though he would sometimes gird at them.

'My darling,' he once said to Kitty after a great reception at her house, and while he stood upon the hearth-rug, the last guest, previous to departure for the smoking-room of his club, 'you have had a charming evening, and all these people have made themselves agreeable—or tried to do it; but don't be deceived by appearances: you had three or four hundred "dear friends" here, but not half-a-dozen of them are really worth a button. You know we have tried it.'

'Well, papa, I think we should make allowances. People neglected us when we were poor,

no doubt; but no one—as a rule—acknowledges a claim which is founded only on sentiment; or if they do, they soon get weary of satisfying it. Then, again, it is easy to say: "If we had been in their place we should have acted very differently." Perhaps we should, indeed I know we should; but *they* didn't know it. I have no doubt excuses—such as appeared justifications—occurred to them very readily.'

'Nor I neither, my dear,' laughed Dalton. 'What I fear is, that, like your dear mother, you are so unsuspicious and so tender-hearted, that you take *au sérieux* (as poor Holt would have said) all these fine folk's professions. Now I believe that all the really good honest friends who would stand by one at a pinch can be counted upon the fingers of my two hands.'

'Then, my dear papa, you are still very credulous,' was Kitty's unexpected reply: 'it has long been my conviction that the fingers of *one* hand would be amply sufficient for the computation.'

THE END.

FLOWER-MISSION WORK.

FEW of the numerous kinds of charities so widely practised in this country can possess a greater charm or more pleasing an aspect for the mind of the philanthropist than does the newly imported idea of distributing beautiful and sweet-smelling flowers among the sick and infirm poor. Materially, this charity may not convey so favourable or substantial an impression as do other forms of properly directed benevolence; but there is, nevertheless, attaching to it a power of mental good not possessed by many other charities, and whose value is to be rated at a very high standard. In times of sickness, the mind just as much as the body is in need of a more refined and delicate kind of diet, its ordinary food requiring for the time being to be abandoned. And nothing could be more exactly suited for this particular species of mental food than flowers, which will help to soothe, cheer, or brighten the weary hours of the invalid. Good food and clothing, many will say, are the best forms of charity to shew to the poor when ill or infirm. This is, of course, very true so far; but then, may our benevolence not extend further than this? We think it may: by the aid of flowers.

How joyously and thankfully the products of garden or field are received by the sick poor is only known to those who have been much amongst them, and few have been more so than Miss Florence Nightingale. Let us therefore extract one of her *Notes on Nursing* bearing on the subject, and which merits much attention in connection with flower missions generally. She says: 'The effect in sickness of beautiful objects, of variety of objects, and especially of brilliancy of colour, is hardly at all appreciated by the general public. . . . I shall never forget the rapture of fever patients over a bunch of bright-coloured flowers. I remember (in my own case) a nosegay of wild-flowers being sent me, and from that moment recovery becoming more rapid. . . . I have mentioned the cruelty of letting a patient stare at a dead-wall. In many diseases, especially in convalescence from fever, that wall will appear to make all sorts of faces at him; now flowers never do this. Form, colour, will free

your patient from his painful ideas better than any argument. . . . People say the effect is only on the mind. It is no such thing. The effect is on the body too. Little as we know about the way in which we are affected by form, by colour, and by light, we do know this, that they have an actual physical effect.'

Not only, then, does this experienced authority corroborate our own views about the mental good derivable from flowers, but she also tells us and proves that they have a corporeal influence as well. With this in mind, then, we cannot too greatly laud the recently imported idea of establishing special institutions for distributing flowers among the sick and infirm poor; nor can we too strongly recommend their further development and extension. The restriction of the distribution to the 'sick and infirm' is only natural, as the healthy pauper is seldom in need of such gifts, since he has often far more opportunity of seeing and enjoying nature itself in all her original beauty and grandeur than many above him in the social scale. It is by the indoor or the bedridden pauper that any reminiscence or memorial of the country must be the most gratefully hailed.

To America is due the idea of Flower Missions; and its importation into this country is only of comparatively recent date. Although the idea has taken deeper root in the provinces, as is after all but natural, yet attempts to organise institutions of the kind in the metropolis have by no means been wanting, and it is to be regretted that those efforts have failed in the success they so much deserve. Of these attempts, the most successful and abiding, perhaps, is the 'Bible Flower Mission,' which has performed a very fair amount of good work in the East end of London, where its influence has been brought to bear upon many of the hardened and depraved characters of that rather rough and demoralised population. That the institution is the result of female enterprise says much for the courage, zeal, and perseverance of its lady-agents, who so readily penetrate one of the most uncouth and uncivilised parts of London in the interests of Christianity and of charity; and that their indefatigability evokes now and then some gleam of a better nature existing under a rugged exterior, is a reward the full value of which can only by them alone be measured.

But it is to the provinces that we must turn to get any reliable and useful information regarding the Flower-mission movement and its results. Missions for the propagation of this form of charity have been established with more or less success at Liverpool, Glasgow, Edinburgh, and Leeds; but to Hull belongs the honour, we believe, of first making the experiment, where the greatest fruits have occurred from the work; and it may be well here to remark, that in pursuing our observations on the subject in point, we think we cannot have a better system for our model of this good work than that carried on at Hull, although, of course, there can be little or no difference between any organisations of this kind.

One of the most important points in all Flower Missions is the necessity of making frequent appeals to the generosity of those richly or at all endowed with flower-gardens; and this is done through letters addressed to the newspapers of the locality, setting forth the object of the Mission. At Hull,

the first letter of this sort was published on the 5th April 1873, being a simple request for 'primroses and violets' and other spring flowers, made up into small posies for distribution among the sick, infirm, and aged poor; and the same day, we are told, a number of dainty little bouquets of spring flowers, arranged by the Principal and scholars of a ladies' school at Partington, arrived as the result. From that day the work grew with such rapidity as not even its most sanguine promoters had ventured to hope for, and is now in so thriving a condition as to enable a most satisfactory and pleasing record of the fruits thereof to be made in a recently issued Report of the 'Hull Flower Mission,' now before us, and for which, by the way, we may here acknowledge our indebtedness and thanks to Mr Walliker, the moving power and most indefatigable of the supporters of the institution.

The Report in question tells us that during the year 1875 were distributed 17,515 bunches of flowers; of lavender, 918; of wild grasses, 113; of wheat ears, &c. 1080; bags of grapes, 30; parcels of apples, pears, gooseberries, currants, &c. 51; plants in pots, 54; pots of crocuses in flower, 61; poppet-shows, &c. 70; leaf pictures, 29; two-ounce packets of tea or tobacco, 67; packets of hulk, 600: making the several distributions amount to a total of 20,594. In 1874 the distributions amounted to 14,322; and in 1873 to 8654: making the total during the whole period of the existence of the Hull Flower Mission, 43,570. These figures speak most favourably for the amount of work done by the Mission since its formation. Nor do they represent all that has been done for the sick and infirm poor in that town and its surrounding districts, for amongst a large number of special contributions that have been made, we notice such pleasing and useful articles as hanipers and sacks of fruits and vegetables, pots of musk, almanacs, text-cards, and many other pretty and suggestive gifts. In many hundreds of cases the flowers are accompanied by prettily illuminated cards, the work of ladies' deft fingers. In Edinburgh the blind poor received with their flowers text-cards, on which the letters were pricked out, so that they could read them by the sense of touch.

In Hull, supplies of flowers of all kinds arrive daily at the chief depot from the surrounding districts, being generally sent in baskets, which, when empty, are returned or called for; but some of the flowers arrive in specially constructed baskets, which are placed near railway stations for the convenience of those who cannot undertake the direct forwarding of them to the depot. The baskets are made of strong wicker-work, with wire trays inside, each bearing an enamelled plate lettered, 'Flowers for the Sick and Infirm Poor of Hull, from —;' the name of the place varying, of course, on each basket. The services of some one to co-operate in the work is secured at each station, who sees that the baskets are duly forwarded by rail on certain stated days. The system of collecting the 'village baskets' is worked in this manner: A resident in a village undertakes the charge of a 'basket,' which is supplied with two permanent labels attached—one addressed to the chief depot in Hull, the other bearing the address of the resident in the village. Printed cards, kept for the purpose, are then filled

up and addressed to all those who are likely to contribute to the 'basket,' and they are told where it is, and the day and hour it will be despatched. Flowers are received, and the basket forwarded, either by carrier, rail, or boat to the chief depot; and is returned again the same day, in order to be ready for the next despatch.

Arrived at the central depot, all the baskets are immediately unpacked, and those flowers which are quite fresh are sent out as soon as possible to the district visitors, about fifty in number, and others who undertake their final distribution; while those that are drooping are placed in the water-trays of the flower-stand (each tray having wire-net work over it) until their brightness and freshness have been restored. All flowers contributed to these baskets are acknowledged to the donors by post-card as well as being recorded in a book, the pages of which are ruled into columns for the entry of the date, name, address, and remarks. The object of this record is to shew how the flowers are disposed of, so that the number of distributions made in any one day, week, month, or year may with ease be ascertained, and thus a proper control and check be kept over the supplies.

The busiest part of the year for flower missions must naturally be between the months of April and October; and during this period the Hull society employs at weekly wages a boy, clad in uniform, to receive and unpack the flowers as they arrive, to place them in baskets provided for the purpose, and to deliver them at their respective addresses. It may also be worth mentioning that even out of the flower-season much good work may yet be done by the use of various kinds of leaves, hips, hawthorn berries, and the like. By any one of an ingenious and original turn of mind a variety of pretty and delightful devices can be executed with such material. Says Mr Walliker: 'Pots or pans with moist sand, over which grains of wheat are scattered, and in the centre of which one or more carrot tops (slices from the tops of carrots), covered by pretty moss, are placed—or, in the case of pots, in the centre of which moss-grown, lichened-covered branches of trees and sprays of arbor vitæ or other evergreens are placed, make lasting and pretty objects. Ivy twisted round the moss-covered branches, fastened thereon with wire, and planted in the damp sand, lasts long and is very effective.'

The question of money in connection with Flower Missions cannot be left out of consideration; but after all, the amount necessary to carry on an institution of the kind is not very great—it need not exceed twenty pounds annually. The Hull expenses are kept below this sum, and yet the work done by the Mission there, we have seen, is of no small measure or mean value; the chief items of expenditure are on account of carriage and collection of baskets, wages of boy-messenger, and correspondence.

In conclusion, without desiring further to enter into any argument in favour of Flower Missions, we may perhaps remark that the delight with which it is found donations of flowers are received by the poor is in itself a sufficiently cogent reason for urging the greater extension of the work throughout the country, while the moral influence gained by this means over the recipients adds more weight still to the recommendation. Many a 'God bless the people who sent them' is extracted by the distributions of flowers; and one poor old widow at

Hull was so gratified with a sweet posy given to her that she placed it in her window and refused the offer of sixpence for it by a gentleman whose notice and admiration it had attracted while passing, although it is known as a fact that she hardly knew what it was to taste a piece of meat; thus shewing in what measure flowers are valued by some poor people. If in this paper we have entered somewhat into detail as to the method of conducting Flower Missions generally, and of the Hull system in particular, we may be permitted to advance as a plea for so doing that we have been actuated by but one motive, namely, the desire to do all in our power to extend the flower-work as much as possible, and to awaken some spirit of emulation in those districts where the experiment has not yet been tried. With this object, and it alone in view, have we ventured to take up the pen in the cause of the sick and infirm and aged poor, that thereby some of those sad and weary hours which come to the most of us now and then during life's term, may to them in some degree be softened and modified by the sight of a garden, a field, or even a wayside flower. It would be especially pleasing if a Flower Institution of an extensive nature could be established in the metropolis of London on a permanent basis. We can only hope, however, that some day soon this may be really the case.

INDISCRIMINATE ACQUAINTANCES.

IN TWO CHAPTERS.—CHAPTER I.

'WHERE shall we go to, girls, this year? Most votes ought to decide it; and as your papa can't come with us for the whole time, he won't mind where we are.'

'To Scarborough!' we three girls exclaimed almost simultaneously in response to our mother's question.

'Why to Scarborough?' she asked, surprised at the unanimous desire; for though a very friendly trio, still sometimes we were not so united in our wishes.

'Because it's a delightful place,' replied Nora.

'And loads of people, and a band plays constantly,' added Emmy, the musical one of the family.

'And the bathing is delicious,' I chimed in.

'I thought of Aldborough,' said mamma musingly: 'it is a nice quiet place, I hear, and not half so expensive as Scarborough.'

'Aldborough!' echoed Emmy; 'of all places under the sun it is the dullest. Madge Pierrepont told us quite enough about Aldborough. O don't let us go there, mamma.'

Perhaps it was not unnatural that we should have united in making a stand for Scarborough, for we were all young. Nora, the eldest, was two-and-twenty; Emmy, a year younger; whilst I had only just arrived at the mature age of eighteen. We had two younger brothers at school, Jack and Edward, and one small sister of seven years old—the pet, plaything, and baby of the family—Rose by name. We had always lived in the country, and as yet, even Nora had been satisfied with the very limited gaieties our neighbourhood afforded. However, we had lately had our imaginations

considerably dazzled by the very vivid descriptions, drawn for our benefit, of the charms of the queen of watering-places, by a gay cousin who had favoured us with her society for a few weeks. She had found King's Court very endurable for the first few days, and been most charmed with what she called our Arcadian simplicity. The cows and the poultry-yard came in for a large share of admiration; and she almost envied us, she said, of our free country-life. We had each our own riding-horse, and a roomy basket-carriage with a couple of ponies of our own, in which we drove about most independently; in fact, no reasonable indulgence was denied us; and until the advent of Florence Ferrars, it had never occurred to us to dream of associating dullness with our dear old home.

'How you girls can stand it,' she said, when her own *ennui* had grown insupportable, 'I do not know. I should die of dullness if I lived here; and if my father was as rich as yours, I should be very sorry to put up with it.'

'But we aren't dull,' I ventured to say; 'we have always lots to do. Besides, when the boys come back, we have enough stir in the house.—Haven't we, Emmy?'

'Yes,' replied Emmy falteringly.

'The boys!' echoed Florence disdainfully. 'Really, Esme, you are a greater baby than I thought you were. Who cares about the boys?'

'Everybody in this house,' I answered somewhat viciously.

But Florence, taking no further notice of me, ignored their importance, and explained more glowingly than ever to Nora and Emmy the delight of a gay life, advising them, if they possibly could, as a first step, to induce mamma to select Scarborough when we started on our annual trip to the seaside.

I was fascinated myself with her account of it. Accordingly, when the question of where we should go to was mooted, the answer, as I have before said, was unanimous. The question of expense was not likely to be any barrier to the gratification of our wishes, as our father, whom I ought before to have introduced as Mr Haughton of King's Court, had a handsome fortune, and was the very last to deny us anything upon which we had set our hearts. He was the most indulgent of parents, next to our mother, who was equally yielding; but we fancied, perhaps really felt, that of the two in a question of right and wrong, he would be the firmer and most difficult to get round.

'He had sundry prejudices too—old-fashioned notions,' Florence Ferrars said, 'which now we were grown up we would do well to unroot and overcome.'

This last statement of hers surprised us all very much, for we had been accustomed to regard him as a veritable oracle of wisdom and knowledge; and the idea of our having to correct anything in him appeared truly absurd. However, experience has since shewn me how a bad influence can corrupt and undermine the very purest feelings; so now I am not so surprised that Florence's words were not without the weight she intended them to have.

Owing no doubt to Florence's hints, we by common consent refrained from entering into any detailed list of our reasons for so much preferring Scarborough, when the question arose before our father. He made no objection, only telling us that

we must take care of ourselves for a few weeks there, as he could not, owing to some tiresome county business, accompany us.

In due time, arrangements were made for our occupying a very nice house upon the esplanade; and when everything was fairly fixed, Nora wrote to Florence, and told her how joyfully we were anticipating becoming personally acquainted with the gaieties she had described. An answer came back with greater rapidity than Florence's epistles usually appeared; but she could not help writing to say how glad she was that at last we were to be allowed to have some fun (so she termed it); and she only wished she could share it with us, she did so long for a change; for she was staying just then with an elderly aunt, who did not enter very cordially into the general tone of Florence's conversations.

Poor Florence! We all began to pity her. It was very hard for her to have to be shut up with Aunt Emily; and by degrees we came to the conclusion that we could not do better than advise our mother to ask her to join us at the seaside. She would be invaluable at Scarborough, particularly as she knew the place, and would be able to help us in a hundred ways, for we were thorough country girls. Hitherto, we had been perfectly satisfied with our holland dresses and shady wide-brimmed hats; but we should require to be more in the fashion now; and our mother, who had married when very young, and whose life had been a singularly retired one, was nearly as innocent and unsophisticated as we were ourselves. So Florence, in virtue of her experience and cleverness, would be bestowing quite a favour if she would consent to come; and having easily obtained leave to invite her, Nora despatched a pressing invitation; which, as may be imagined, was promptly accepted.

Florence was a very pretty girl. No one ever dreamt of denying her claims to beauty, whilst her manner was one of the most fascinating I ever encountered. She was one of those girls who manage to look well, no matter what they may wear—everything seemed to suit her; and when she appeared, the first morning after our arrival, exquisitely dressed in a combination of brown velvet and silk, with a Gainsborough hat to correspond, we involuntarily gazed at our own simple dresses in absolute dismay.

'Where are you going to, Florence?' asked our mother, scared herself at the grandeur.

'Going?' echoed Florence. 'Why, to the Spa.'

'I should have thought you were going to some *fête*,' rejoined mamma.

'O no,' laughed Florence; 'everybody dresses decently here.'

We three, who were clad in such different style, involuntarily looked at each other; and then Emmy, who felt the most aggrieved, said: 'We can't go out, then, like this, mamma. We must get proper things.'

'You look very nice, Emmy,' answered our mother. 'Don't be dissatisfied. Nora and Esme are not complaining.'

'It's a shame,' said Florence, when, under her escort, we entered the gardens and made our way down to the promenade. 'One would think you were nursery-maids, instead of the rich Misses Haughton of King's Court.'

'Do we look odd?' asked Nora, flushing almost

painfully, but as it died away, looking the personification, in my opinion, of fairy-like prettiness; for Nora was really far beyond Florence in good looks, though she had not her wonderfully bewitching manner.

'Rather like young women from the country,' laughed Florence; 'but never mind, we must coax Aunt Haughton down into the town, and make her open her purse-strings.'

Was it because we were such objects that so many people looked at us when we got down to where the band was playing, and began to mingle with the crowds who were walking about? We concluded that it was, and after some persuasion, got Florence, who did not care to be stationary, to sit down. Rose and her maid presently joined us; so we made quite a large party. We had to find an unoccupied seat, if we were all to sit down; so we wandered along in quest, until we saw one upon which a solitary gentleman was seated.

'That will do,' said Florence: 'we can all sit here;' and she stopped, making a pretty gesture of marshalling us to our places. 'Nora, darling, you sit by me.—Oh, thank you so much.' This latter sentence addressed to the occupant of the seat, who moved towards the end in order to accommodate us.

I never could understand Florence's accessions of sudden affection for us when we were within hearing of other people; but I always noticed that we became very precious to her if there was the slightest chance of her endearments being overheard. On this occasion we were all very high up in her good graces; even Rose, whose existence she had hitherto hardly noticed, was graciously pressed to seat herself on the unappropriated side, which chanced to be next to the gentleman. The latter remained for some time apparently wrapped up in the perusal of his newspaper, which he had been reading when we came up to the seat; but at last he got up and moved slowly away.

'What a handsome man!' exclaimed Florence. 'I wonder who he is? But we can easily find out, as he is sure to be staying at one of the hotels. We shall very likely get to know him.'

'How?' asked Emmy, with innocent wonder.

'Oh, if we go to any of the balls,' answered Florence. 'He has probably come here to recruit, and will stay for some time. He's an officer; you can see that at a glance.'

'Are officers so different from other men?' I asked, rather interested in Florence's certainty with regard to the stranger.

'Yes; of course they are. There's a look—oh! something I can't exactly explain, but unmistakable,' pronounced Florence.

'You had better not propose our going to any dances until papa comes,' put in Nora gently. 'Mamma would not like it; and you know we could not go without him.'

'Nonsense, Nora. If there's going to be a good ball, I'm going—so are you. If Mrs Devereux is here, she will take us; and I am sure she must be the very Mrs Devereux whose name I saw in the list of people at the *Crown*. She will take us everywhere, if Aunt Haughton doesn't like to go.'

'Mamma would never let us go without her,' I said in a very positive tone; 'not if we asked a thousand times over; I know she wouldn't.'

'Well, perhaps she is right to keep you babies as long as possible,' returned Florence airily. 'You

certainly are sweet babes, so obedient!—Rose, my darling child, do try to sit still.' The stranger was passing by as she spoke, and cast as he did so what I thought was a very cool stare at us.

I did not like him even then, though I could not deny that he was a very good-looking man: it was only the *tout ensemble* that struck me as being very gentlemanlike; but the large dark eyes had an expression in them, whether it was boldness or what I could not have defined: it was one I shrank from, though they rested but a second upon me; the longer look fell upon Nora, our pretty sister, and, to my surprise, I noticed that she was blushing.

He walked slowly past us several times; and it was only when she saw him ascending the steps leading upwards towards the esplanade that Florence would hear of our moving homewards.

I suppose it was some instinct that prevented us from giving our mother any suspicion of Florence's true character, for we by common consent refrained from the slightest hint that her conversation was upon topics which we felt sure would not be approved of. Little did we know what her companionship was to end in, or else we would have paused before we were so reticent. Paused, did I say? I think I would almost have died sooner than what did happen should ever have come to pass, for she was the cause of it.

Days flew by, bright lovely sunny days, and at last the name of the stranger, who still lingered, was discovered, by Florence of course, to be Gerald Gore; a Colonel, an Honourable, and what was still more satisfactory to her, a most eligible *parti*. Mrs Devereux, who, as Florence had hoped, was staying at one of the hotels, had made his acquaintance at the *table-d'hôte*. He had satisfactorily explained who he was. His regiment was in India; and he was sojourning—as Florence had so quickly guessed—at Scarborough solely for the benefit of his health, which his residence abroad had somewhat impaired. Through Mrs Devereux's good offices, an introduction to Florence and, as a natural sequence, to ourselves followed.

Mrs Devereux was a pretty but rather *passée* widow, who made up for her 'lone lorn' condition by going wherever she thought the most amusement was to be found. She was well off, so could afford to gratify her gay inclinations; and she flitted about here, there, and everywhere, as brainless and heartless a little butterfly as could well be imagined. She was charmed to meet her dearest Florence, still more apparently enchanted to make our acquaintance; and she greeted our mother in such a gushing, bewilderingly effusive manner that one would have supposed they had formerly been old friends, instead of total strangers up to that time. She was most lavish in her offers to chaperone and take care of us: it would be such a pleasure to her; she would be so proud of the charge of the Misses Haughton; and I could distinguish most audible encomiums on our good looks, which, of course, we were supposed not to hear. Nora was lovely, a regular *Croix*, a picture, a study; her every movement was so graceful, so elegant. Emmy and I had to be satisfied with less rapturous praise: we were *distinguées*; and a likeness was found between myself and a celebrated Magdalen by Guido which she had almost worshipped at Venice.

'She is a humbug, Emmy,' I said, as we two

stood on the balcony of the drawing-room windows catching words here and there of her discourse.

'I think so too,' said Emmy.

But mamma and Nora were greatly delighted with her; both were so innocent and unsuspecting themselves, that it never occurred to them to doubt the sincerity of Florence's friend. So it came to pass that Mrs Devereux, Nora, and Florence were constantly together; and never were the trio to be seen except under the escort of Colonel the Honourable Gerald Gore. I fancy now, when I look back calmly, that Florence must have appropriated his attentions as intended for herself; she was so highly pleased and pleasant all the time, and so anxious to learn everything with regard to the connections and prospects of that individual. All she found out was in his favour, as by the Peerage—which, of course, was immediately consulted—he was described as the Honourable Gerald Gore, eldest son of Lord Raymond, and heir to Raymond Castle, Gore Place, with a town residence in Portman Square, &c. He must be enormously rich—he could load her with diamonds, no doubt; and she might have her opera-box and countless other delightful indulgences which she had hitherto been denied.

Florence doubtless wove many a rosy romance; but the dark eyes of the Honourable Gerald had fallen not upon her, but upon our pretty sister Nora; and alas! before poor innocent unsophisticated Nora knew it herself, she had bestowed upon him the first affections of her young and innocent heart. I am sure I knew she loved him before she knew it herself; for I had nothing to do but to look on, and being of an observant nature, I noticed many trifling circumstances which probably the most of people would have overlooked altogether. I think mamma was becoming rather uneasy at the growing intimacy; for it was with evident trepidation she announced to us one morning that our father intended joining us the next day. Perhaps she felt she had been rather imprudent even as regarded Mrs Devereux, but more particularly the colonel. Perhaps it was because she knew that our father would object to our being on such friendly terms with a man who was a stranger to him. Whatever it was, a silence fell upon us when his letter was read—ominously prophetic of the dark cloud that was coming.

There was a grand gala in the gardens that evening, and we were all going; even Rose was to be allowed to sit up to see the illuminations and to witness all sorts of wonderful floating balloons, which as yet she had only heard of but never seen. Mrs Devereux appeared attired in a most bewitching toilette, Florence in another, whilst we were wonderfully smart in white piqué dresses trimmed with red braid, and pretty white hats to correspond. As usual, Colonel Gore loomed in the distance, and presently joined us, falling behind after a time, as if accidentally, with Nora; however, Rose kept closely by the side of the latter, and as the crowd stopped our progress, I heard the child say: 'Papa is to be here to-morrow.'

'Is he?' inquired Colonel Gore, evidently addressing Nora. 'Is he really coming?'

Nora's reply was lost to me in the rapid rush of an ascending rocket, for darkness was just beginning to come on, and the fireworks began in earnest. We got separated in the end, and I kept looking vainly for them. At last, when I

least expected it, I was suddenly arrested by hearing a low but distinct voice close by me saying in most impassioned accents: 'My own darling, you will!'

Turning rapidly round, I beheld Nora, flushed and I thought tearful; whilst over her was bending the handsome head of Gerald Gore! I was speechless and thunderstruck. It seemed to me to be the greatest audacity on his part to dare to address such words to my sister; but she did not apparently resent them, nor did she, strange to say, appear to suspect that I had overheard them.

The rosy transformations, the blazing representations, the myriad showers of softly falling golden many-coloured changing stars were lost upon me; through the whirling wheels and the whizzing rockets I seemed only to hear one voice whispering: 'My own darling, you will!'

What would Nora tell me when we got home? What were we all to hear? for that there was a confession to be made to us was as certain in my mind as it was that Colonel Gore had confessed his affection to Nora's self.

I waited when we did get home, so sure, so certain she would speak; but not a word came. She was silent, and paler than usual; whilst Florence's fair face was darkened with a very palpable frown; she was evidently aware that Raymond Castle, Gore Place, and Portman Square were dying into distance as far as her interest in them went, to say nothing of the diamonds and the opera-box.

After a time, Nora slipped quietly out of the room, and I lost no time in following her.

'Nora,' I said, 'Nora, dearest, I know!'

'Know what?' asked Nora, as she turned her face away from me, and pretended to be busily engaged in undoing her fair tresses.

'I heard—O Nora, you know what I heard this evening in the gardens!'

'I don't,' she answered slowly.

'O Nora!' was all I could say, very reproachfully, waiting in silence afterwards, hoping she might tell me of her own accord what it was evident I had not been intended to hear; but I waited in vain; she would not tell me; and the next day papa arrived.

'Who is he? Where does he come from? What is he doing here? How did you make his acquaintance?' were a few of the questions he asked when he first heard of our friend Colonel Gore.

THE LORD MAYOR OF LONDON.

HIS FUNCTIONS AND DIGNITIES.

THE Lord Mayor is, so to speak, king of the City, a king who sorely puzzles foreigners. They see him and his queen or lady driving about in equipages far more sumptuous than those of royal Victoria; they hear him called 'My Lord;' they know that the greatest potentates of the earth dine at his table; and yet they find that, after a brief reign of twelve months, he quietly and cheerfully resumes his occupation of cattle-salesman, grease-manufacturer, typefounder, or drysalter.

The chief magistrate of the City of London was at one time called the *portgrave*, *portgreve*, or *portreeve*; afterwards *justiciar*. Then he became *mayor*, appointed by the crown, and removable at

pleasure; then mayor elected annually by the citizens; and at last *Lord Mayor*. Some notable men figure in the list of Mayors during six or seven centuries—Sir William Walworth, who so resolutely grappled with the rebel Wat Tyler; Sir Richard Whittington, every schoolboy's Dick Whittington; William Beckford, better known as father of the Beckford who wrote *Vathek* and built Fonthill Abbey; John Wilkes, the famous Radical who troubled the government of George III. so sorely; Francis Child and Richard Hoare, the great Fleet Street bankers; and many others. Most of them have been commercial men; but the first, Henry Fitz-Elwyne, was possibly a courtier, for he held the office twenty-four years. According to the system afterwards introduced and still maintained, an annual election must take place; but the same person may be re-elected. A few, like Whittington, have thrice filled the mayoralty; and a very few (more than five centuries ago) have filled it four, five, or even six times. Some provincial corporations have much exceeded these limits, having re-elected one mayor as many as eleven times; while one particular Irish corporation has gone so far as twenty-three re-elections. Noblemen have not, so far as the list shews, been mayors or Lord Mayors of London; whereas two Cecils have been Mayors of Stamford, a Stanley Mayor of 'proud Preston,' a son of one peer Lord Mayor of Dublin, and a son of another peer Mayor of Drogheda. Londonderry in bygone times thought fit to make one particular clergyman its Mayor five years in succession.

A knotty point it has been to determine whether these civic dignitaries are 'Worshipful,' 'Most Worshipful,' 'Honourable,' or 'Right Honourable'; and we are not certain that the problem is solved even yet. The Lord Mayor of London is summoned to the royal palace to sign his name to the proclamation of the accession of a new sovereign; and this has been deemed a justification for awarding to him the Privy Councillor's title of 'Right Honourable.' Mr Mayor is jealous of his dignity in all provincial corporations; he claims precedence over the sheriff of the town, and over the high-sheriff of the county in all matters relating to the town. But the Lord Mayor of London is a very big man indeed; not only does he take precedence of all the subjects of the crown within the City, but even of the princes of the blood-royal. A notable instance of this took place in 1806, when, at the funeral of Lord Nelson, three of the king's sons—Prince of Wales, Duke of York, and Duke of Clarence—went in the procession; the Lord Mayor claimed and established his right to take precedence of them as soon as they had entered the City through Temple Bar. Two other cities share with London the honour of having a 'Lord' Mayor, namely York and Dublin. In one particular York is more distinguished than the other two cities; for its Lady Mayoress is entitled, if she likes to claim it, to call herself 'Lady' So-and-so for the rest of her life, whether her husband

has been knighted or not. Many, it is said, have exercised this right, which York has embodied in an old rhyme:

The Mayor is a Lord for a year and a day;
But his wife is a Lady for ever and aye.

The Mayoress in some towns has a silver cradle presented to her if she adds a new arrow to the family quiver during her husband's year of office. This ceremony has taken place at York, Liverpool, Accrington, and possibly some other provincial towns. The lady of Mr Alderman Copeland had one of these delicate testimonials presented to her in 1855, when her husband was Lord Mayor of London.

Of course the chief magistrate of our great City is a well-known City-man before he becomes Lord Mayor; and this leads us to say a little concerning his selection and election. The basis of the population of the City of London, so far as concerns corporate influence, is the *freemen*. This body consisted formerly only of the members of the great Companies or guilds; but other modes of obtaining the freedom are now available. The *livery* or *liverymen*, a select body of the freemen, are the principal members of the several Companies. Starting from the mediæval times, when court officials wore the livery or uniform of their sovereign, the baron's retainers the livery of their chief, the cavalier the livery of his lady-love, the confessors and penitents the livery of the Church—starting from this origin, a livery, badge, or distinctive garment of outer clothing was adopted by the City Companies, at one time nearly a hundred in number; and in the early days of the Lord Mayor's show the livery of these Companies made a very gay appearance. As at present arranged, the City is divided into twenty-six wards, each of which is subdivided into precincts. The liverymen collectively form the *Common Hall*. The *Common Council* consists of somewhat over two hundred members, elected by freemen-householders out of their own body, so many for each ward. It constitutes virtually the House of Commons of the City, and has a very influential voice in all corporation affairs. The *Aldermen* are elected for life, in all except a single instance one for each ward, and exercise both corporate and judicial functions. The Lord Mayor and the two sheriffs are elected for one year only. The Lord Mayor must necessarily have been, and be at the time of election, an alderman. We need not go into any detail here concerning the duties of aldermen and sheriffs; suffice it to say that they are mostly of a magisterial character, dealing with offences and offenders against the law.

Let us state a little more precisely the mode in which the Lord Mayor is selected for honour. On the 29th of September every year, Michaelmas or St Michael's Day, the liverymen of the several companies meet in Common Hall. The Crier reads out a list of aldermen, omitting those who have not been sheriffs, and those who have in some former year filled the office of Lord Mayor

or have 'passed the chair.' Generally speaking, there are about eight or ten aldermen eligible. Usually the first two in seniority of aldermanship are selected; for it is seldom that a really contested election takes place. In case the decision is not unanimous by show of hands, a poll is demanded, and the result of the polling is announced seven days afterwards. The two approved names are then officially announced by the Common Sergeant to the Court of Aldermen; and this court decides which of the two to select. Here again seniority is so much the rule that the citizens know pretty well beforehand who will be Lord Mayor for the ensuing year. For example, on Michaelmas Day last year, the liverymen in Common Hall selected the two senior aldermen who had not 'passed the chair,' and then the Court of Aldermen decided on the senior of these two, Alderman Cotton. On subsequent dates, ending with the eventful 9th of November, the new Lord Mayor takes certain oaths in presence of the outgoing Mayor and the aldermen, attends the Lord Chancellor to obtain the gracious approval of the Crown for the choice which the citizens have made, and attends in the Court of Exchequer to be sworn in by the barons of that court. To go to Westminster for this swearing-in is the real purport of what is known to all Londoners as the Lord Mayor's Show, a ceremonious formality still kept up, although its real meaning has departed. After the Norman Conquest, the chief municipal officers were persons appointed by the king to collect from the citizens whatever taxes he chose to impose; and even when the citizens obtained the right of electing those officers, the latter were still bound to render account to the king of moneys due to or claimed by him from the corporation. The Lord Mayor has still, centuries afterwards, to satisfy the King's (or Queen's) Barons of the Exchequer that he is 'a fit and proper man' to undertake this financial responsibility.

The Lord Mayor, though never before so hard worked as he is now (a point we shall notice presently), was in the turbulent days of the Plantagenets and the Roses a much more daring public character. Again and again he confronted the sovereign for the time being, demanding and generally obtaining a restitution of civic privileges which had been imperilled. At one time he joined the feudal barons against the king, at another the king against the barons, according to the varying exigencies of troubled politics. Often the City Companies and he had a struggle as to which should exercise control over disobedient members of the several crafts. As the Lord Mayor's City of London was topographically situated between the king's Tower of London and the king's palace at Westminster, the civic dignitary had sometimes to be consulted before a state criminal could be conveyed to the Tower; and once now and then the citizens saw the Mayor himself escorted by armed men to that stronghold. All things considered, it may be stated that the Lord Mayor of London has for five centuries been an upholder of civil and religious liberty.

Is there any living man in the City of London who works harder than the Lord Mayor? We may almost venture to answer this question in the negative, after learning something of the daily routine. Not of course muscular labour, nor the

plodding brain-work of the counting-house; but an almost unceasing train of duties in which his official good name is concerned.

First come the strictly corporate functions, distinct from those connected with the administration of justice. The Lord Mayor presides at the sittings of the Court of Aldermen both in that court and in the Lord Mayor's court. He presides similarly over the Court of Common Council and the Common Hall, though with an occasional deputy or substitute. He is chief conservator of the Thames. He attends the Commission of Sewers, and various committees for municipal purposes. He is in repeated communication with the government on matters relating to the special rights and privileges of the City, which are greater than those of any other municipality in the kingdom. He has to sign affidavits to certain notarial documents, and to attend to a number of minor duties gradually learned after the showy pageant which inaugurates his year of office.

Next we have a list of his duties in a judicial and magisterial capacity—much more exacting of time and attention than the municipal functions just mentioned. He is a judge of the Central Criminal Court; a judge of the London Sessions held in Guildhall; a justice of the peace for Southwark; a judge of the Court of Hustings. He is escheator in London and Southwark (an occasionally exercised function bearing relation to the fee-simple of estates). And he is a police magistrate at the Mansion-house; an office that occupies more of his time, perhaps, than any other one of his duties.

Even all this is far from exhausting the list. The Lord Mayor is expected to lead off the establishment of subscriptions for the relief of all kinds of extensive sufferings in all parts of the world—floods, earthquakes, shipwrecks, conflagrations, colliery disasters, famines, war-miseries, &c., and to be the custodian of 'Mansion-house Funds' for such purposes. He is expected to preside at public meetings of the citizens in Guildhall. He is one among a select body of dignitaries who attend (as we have already mentioned) the first meeting of the Privy Council after the accession of a new sovereign. He is Chief Butler at the coronation (not a very arduous office, however, and amply remunerated in the form of a golden cup as a fee). He is a governor of Christ's Hospital, a governor of King's College, a trustee of St Paul's School, and governor or trustee of a larger number of other public institutions than we can count. If an Emperor, a Czar, a Shah, or a Sultan visits England, the Lord Mayor is expected to enact the part of host when the illustrious foreigner condescends (if it is a condescension) to enter within the City precincts.

It has been said that the excessive feasting going on in the City, as if eating were the chief employment of corporations and guilds, 'have turned aside public attention, not only from the business capacities of the chief officers, but also from the real nature of the institutions themselves.' And in relation to the almost continuous labours of the Lord Mayor, 'we are not aware how the mere enumeration of such an overwhelming amount of business may affect the fancy of the sportive wits who amuse themselves at the expense of the office and the officer; but we do know that the latter need desire no better revenge than to be

allowed to catch one of these said gentlemen, and place him in the civic chair for a single week.

The Lord Mayor's working day begins earlier than that of most merchants or City men. He has to read a vast number of letters on a great variety of subjects—soliciting office, asking for advice, appealing for his patronage of charities, begging him to open bazaars and exhibitions, soliciting his services in laying the first stones of public buildings or unveiling public statues, &c. His secretary sifts all the letters first, to separate the chaff from the wheat; but still the replies to be sent are very numerous. Then, in the regular business of the day, he signs receipts for City dues, hears applications, grants warrants, &c. About noon he enters the justice-room, robed and headed by his mace-bearer; and there he is generally engaged three or four hours. At various hours on various days his Lordship attends to other duties which we have enumerated above; and altogether he is said to sign his name about a thousand times every week.

The Lord Mayor, in reward for these labours, has—if not

The divinity that doth hedge a king—

at least a certain heaven of regal dignity. He has his sword-bearer, his sergeant-at-arms, his sergeant-carver, his sergeants of the chamber, his esquires, his crier—altogether about twenty members of the household (shall we say 'courtiers'?), who are entitled to be called 'Esquire.' He has a splendid retinue of domestics, and 'maintains three tables daily' at the Mansion-house. The kitchen of that structure has the accessories for cooking the banquets given in the superb Egyptian Hall. The plate chamber, guarded day and night, contains gold and silver plate of great value; this belongs to the corporation, and is only lent to the Lord Mayor, who signs a bond recognising his responsibility for its due preservation. The more rare and expensive banquets at Guildhall are given by the corporation collectively; but the more frequent hospitalities at the Mansion-house are at the option of the Lord Mayor. Option, however, is scarcely the word to employ; he is expected to keep almost 'open house;' and if he does not, he leaves behind him a reputation for shabbiness. Wards, companies, cabinet ministers, judges, bishops, members of the liberal professions, all are invited in turn; and a Mansion-house dinner is a dinner even in the estimation of gastronomic *dilettanti*. The Lady Mayoress, too, gives many balls and assemblies in the course of the year, at which the wives and daughters of wealthy citizens blaze in their jewels like court ladies at the west end. The Lord Mayor has robes for different occasions—black silk, violet silk, scarlet cloth, and crimson velvet. He has also swords for different ceremonies—the common sword, the Sunday sword, the black sword, and the pearl sword. His gorgeous mace, more than five feet high, was a present from royalty.

Of course all this costs a great deal of money; and occasionally an alderman is said to shun the mayoralty on this ground. Although the regular salary is ten thousand a year, with something more in fees, the total outlay generally reaches twenty or twenty-five thousand pounds—the surplus coming out of his Lordship's private purse. The expenses of Lord Mayor's Day (generally over three thousand pounds) are borne half by his Lordship and half by the sheriffs; but the banquetings at

the Mansion-house are paid for out of his purse. He provides the horses for the state coach, the sumptuous liveries, and the state carriage and horses for the Lady Mayoress.

About the grand doings on the 9th of November, we shall see in another article.

CONJURERS AND SPIRITUALISTS.

IN TWO PARTS.—PART II.

THE disappearance of persons from a closed cabinet, and their immediate reappearance in some wholly unexpected quarter; the tying up of men with ropes in a very stringent and complicated way, and the speedy loosening by some agency neither visible nor easily comprehensible; the raising of a table in the air on the tips of the fingers; the causing of a walking-stick to strut about the stage as if a human hand held it; the floating of a human figure in mid-air; the disappearance of a man from a strongly corded box only just large enough to contain him; the entrance of a man into a box covered with canvas and well corded—all these and many other feats performed by the best of our conjurers either imitate and equal the achievements of spiritualists, or excel them without any imitation at all. How the things are done, it is not here to surmise; any one may guess at pleasure; of course it is not the province of the exhibitor, who lives honestly by an exercise of his practice, patience, and skill, to tell us which of our guesses are right and which wrong. Messrs Maskelyne and Cooke's performances at the Egyptian Hall, Piccadilly, the chief of the kind that have been witnessed in England in recent years, are especially rich in these puzzlements; one guess upsets another, and the real clue can rarely be detected. But all is honestly represented as being what it really is—conjuring, or more majestically expressed, experiments based on the known properties of matter and the known principles of science, without any appeal to spiritual or supernatural influences. It is a great blot upon spiritualistic performances, even if all else were trustworthy, that so many of them are carried on in the dark, or in a light so dim that a spectator cannot rely on the accuracy of his vision. Why cannot the 'spirits' honestly come out into broad daylight? Why use a dark closet for the rope-trick (originally an invention by the spiritualists) instead of a lighted stage? If flowers can be made to grow at the command of a 'spirit,' why not by full daylight and on an open table? If guitars are played by invisible fingers under a table, or people's legs pinched by a tricky spirit under the shield of an overhanging table-cover, why not openly with full daylight pouring in at the windows? Let the honest spiritualists separate themselves from the crafty and fraudulent by doing in open day (if they can) what the latter only do in darkness or semi-darkness.

We have spoken above of 'the floating of a human figure in mid-air.' This, we may here add, forms a part of Mr Maskelyne's display of wonders. The exhibitors speak positively of 'Mr Maskelyne's undoubted ascent into the tropical heat of the dome [presumably the arched ceiling of the exhibition-room], and descent therefrom.' The room is so much darkened, admitting only a narrow belt of very bright light, that spectators are not certain of

much more than that *something* floats above their heads; whether that something is substantial or optical, a reflected image of Mr Maskelyne, or the veritable man himself; and, if the latter, how he gets there—are knotty questions. Mr Pepper's (ghost) ingenuities have shewn what extraordinary results may be obtained by a combination of reflected and transmitted light.

In the exhibitions of celebrated automata, such as M. Camus's miniature coach, Vaucanson's flute-player, and Maelzel's trumpeter, there was no pretence; even Vaucanson's duck which dabbled in the water, swam, drank, quacked, made the peculiar movements of a duck, raised and moved its wings, dressed its feathers with its bill, extended its neck, took barley from the hand, swallowed it, made the proper movements of the muscles of the neck while so doing, and (apparently) digested the food, was, like most other automata, honestly put forward as a specimen of exquisite mechanism capable of imitating the movements of an organised being. No nonsense about unseen intelligences or spirit mediums; no necessity for doing in semi-darkness that which was well accomplished in full light. The same may be said of *speaking-machines*, a few examples of which have been witnessed and heard in England. The elaboration of pipes, vibrating tongues, valves, keys, &c. was considerable; but there was no concealment of the fact that a human performer was concerned the whole of the time, pressing down finger-keys or studs which put the sound-producing mechanism into action. The thing was admired for its real merits, without a halo of falsity to enhance its attractions. As to the *Automaton Chess-player*, once so famous, and still occasionally imitated, it was something of a cheat; for a man was concealed within the apparatus, the wheel-work being a mere blind. See *Journal*, No. 632.

And now we come to Messrs Maskelyne and Cooke's Automaton Whist-player, rejoicing in the name of *Psycho*; which for a year or two has been an insoluble puzzle to Londoners and visitors to London. If thinking be necessary in any game, it is assuredly necessary in whist; and *Psycho* meets fairly good players on equal terms. If mechanism does not think, and if no 'spirits' guide the movements of *Psycho*, there must be a human confederate; and this question of confederacy is as great a mystery as anything else. What we are told of the origin of *Psycho* is as follows. Mr John Algernon Clarke had long meditated on a scheme for the construction of a machine for playing at cards; he communicated his idea in 1873 to Mr Maskelyne, whose practical acquaintance with watch and clock mechanism had made him well familiar with the action of wheel-work, &c. Two years were spent in elaborating the details; and early in 1875 *Psycho* was added to the list of amusing wonders exhibited by Messrs Maskelyne and Cooke in the metropolis.

The *Psycho* arrangement is as follows: A figure, considerably less than adult size, and dressed in oriental garb, sits cross-legged on an oblong box about two feet long, eighteen inches wide, and fifteen high. The crown of the head reaches about two feet and a half above the box on which the figure is seated. The box and figure together, are quite portable, detached from everything else, and carried about with ease. On the stage or floor of the

room is placed (not as a fixture) a low broad stool; on this is placed, upright, a hollow glass cylinder about eighteen inches high by ten in diameter; and on the cylinder is placed the box supporting *Psycho*. The stool, cylinder, and bottom of the box are turned up and about, and shewn separately to the audience before the performance begins; while small windows in the side of the box and figure give a peep into the inside. There is no doubt that the smallest of Tom Thumbs would fail to find sitting or crouching room within; and on all sides the idea is given up that there is any living person within the machine; a repetition of the trick of Kempelen's 'automaton' chess-player—in the interior of which, as we have said, was concealed a human being—certainly does not occur here, whatever may be the nature of the real mystery. The box and figure are free from contact with anything behind, such as a scene or a screen, as any of the spectators may approach and walk round them. They are free from overhead connection, as a stick is passed horizontally over the head of *Psycho*. They are free from side connections, as the audience can see clearly past the right and left sides of them. Lastly, they are free from connection with the floor underneath, except through the medium of the transparent glass cylinder on which the box rests, and which is open at both ends. Rarely has an exhibited figure made so near an approach to complete isolation as this. *Psycho*'s right arm, in a sleeve of oriental cut, has a power both of vertical and horizontal motion.

Next for the stage arrangements connected with the playing of a game at whist. A table is placed somewhat in front, but on one side of *Psycho*, with chairs for three persons. Three visitors are invited to come upon the stage. There is every reason to believe that collusion has no place here; whether the persons are known one to another, or to Mr Maskelyne, or are strangers who happen to be present on that occasion, the proceedings are just the same, the only condition being that all three shall have a fair knowledge of whist. An open space of five or six feet is left between *Psycho* and the table, and Mr Maskelyne is generally somewhere within this space. A pack of cards is placed on the table, and the players cut for partners, Mr Maskelyne cutting as deputy for *Psycho*. The three players sit down, *Psycho*'s partner opposite to him, and two of them cut for deal. The cards are then shuffled, finally cut, and dealt, just as in ordinary whist-play. Mr Maskelyne takes (backs uppermost) *Psycho*'s thirteen cards, and inserts them one by one in a quadrantal rack or frame in front of the figure; the bottom edge of each card being held in a groove, the rest of the card standing up freely, with its face towards *Psycho*. The play begins. Mr Maskelyne announces audibly the name of the card put down by each player. When it is *Psycho*'s turn to play, the figure raises its right arm, and passes the hand gently along the tops of the cards; the hand stops over some one particular card, the finger and thumb clasp it, pull it out of the rack, and *Psycho* holds up the face of the card towards the audience. During this time Mr Maskelyne is at least a yard distant, and does not touch any part of the figure, the box, the glass cylinder, or the supporting stool. The length of the sweep of *Psycho*'s arm depends on the position

of the cards in the rack ; for the best card to play at any particular moment may be the first in the rack, or the thirteenth, or any intermediate position. Psycho *appears* to look at his several cards each time, and to pick out that which may be most advantageously played ; real mental deliberation is as nearly imitated as it can well be. Mr Maskelyne approaches, takes the selected card from Psycho's hand, and throws it down on the table as part of a trick—won by Psycho and his partner, or against them, as the case may be. Thus the game proceeds, trick after trick. Mr Maskelyne announces audibly the names of all the fifty-two cards played ; but he never *tells* Psycho (so far as we know) what card to play. Psycho's partner arranges the tricks which these two have won. Only one deal is played at each exhibition ; it sometimes scores most for Psycho and his partner, sometimes for their antagonists, according as the cards happen to lie, or as the players are equal or unequal in skill.

Now, how is all this accomplished ? A search at the Patent Office tells us that the preliminary steps for a patent were taken by Mr Maskelyne and Mr Clarke last year. The patent is for 'Improved Means for Actuating Automatic Mechanism.' The specification speaks of condensed air, rarefied air, a pedestal reservoir, valves, a piston, a coiled spring or weight, a fly-wheel, a fan-blast, and bellows within an automaton figure. But the description, unaccompanied by any diagram, is difficult to make out ; and no hint is given as to whether it applies at all to Psycho. We are not to forget that there have been such things known as patents taken out as a mere blind, to throw an inquisitive public on the wrong scent.

Spectators are left to guess as they may. If Mr Maskelyne presses his foot on a lever or spring, it certainly cannot be detected. If an assistant can see Psycho's cards, where he is placed is a puzzle. Whether the words uttered audibly by Mr Maskelyne contain instructions or advice as to what card shall be played by Psycho, we do not know ; it is possible, but probabilities go against it.

Professor William Pole, F.R.S., who is known to be skilled both in mechanism and in card-play, has gone at some length into speculations concerning the philosophy of Psycho. He states that the figure can play piquet, écarté, cribbage, and other card-games just as well as whist. He has given all the details of a game—or at least one hand of a game—which he witnessed, and which was well contested on both sides ; Psycho and his partner scored two by cards and two by honours. Professor Pole passes in review, one by one, various speculations as to the mode in which the automaton is actuated. He gives up all idea of a living being concealed within the mechanism. He equally dismisses any belief in connecting-wires proceeding from the figure to a confederate ; the isolation seems too complete for this. He discusses the agency of magnetism and the agency of heat, but without giving a verdict in favour of either of them ; and takes refuge at last in pneumatics. He conceives that an air-passage may exist in one of the legs of the stool, placed over a small invisible hole in the stage ; the air-passage extending up through the glass cylinder, the box, and the figure. An air-pump, under or behind the stage, could either condense or rarefy the air in the apparatus. If the bottom of the box, resting on the open end of the cylinder, consists of an elastic

diaphragm, this would bulge slightly up or down according as the air beneath it were condensed or rarefied. It is within the grasp of delicate mechanism to make this bulging act as a moving force, which, through the medium of valves, levers, &c., might set in action the arm, hand, and fingers of the figure. Possibly compressed air may produce the horizontal movements of the arm, and rarefied air the vertical. All this is or may be scientific and mechanical ; but Professor Pole frankly confesses his inability to see in what way human intelligence is concerned. If Mr Maskelyne knows all the cards in Psycho's hand, and signals which to play on each occasion, he is virtually the player of that hand ; but if he does not possess this knowledge, nor give those signals, then a confederate is the real player, relying on a knowledge of Psycho's cards obtained we know not how.

The great authority on whist, 'Cavendish' (an assumed name), has played with the figure as partner, and bears witness to the skill with which Psycho's hand is played. Professor Pole, while witnessing a game in which he himself did not play, says : 'I confess that to me, standing beside this little wooden doll, apparently isolated from any human agency, and seeing it not only imitate human motions, but exert human intelligence and skill, the effect seemed weird and uncanny ; and I could hardly wonder at the spiritualists, who seriously conjectured that Psycho may be one of the manifestations comprised in their own psychological creed.' Those who have gone most fully into the subject believe that, if they knew the real method of operation, they would admire the scientific skill quite as much as they now admire the well-concealed mystery.

The other feats of Psycho need not be described. Once admit that human agency can make him play a hand at whist, and we may well believe that he can perform sums in arithmetic, spell words in 'spelling-bee' fashion, guess the cards chosen by persons among the audience, imitate handwriting, &c. Ordinary conjuring, *plus* the Psycho mechanism, will produce these results.

We are, we think, justified in saying emphatically, that scientific men and mechanical constructors, by the exercise of well-trained intelligence, can produce results fully as marvellous as any recorded of spiritualism, and more marvellous than any that can be regarded as really well authenticated. There is skill shewn in (so-called) spirit photography, but it is skill applied to an improper purpose ; and the same may be said of many other money-making exhibitions in which 'mediums' are concerned.

One word more. It is no heresy against science to suppose that there may be physical forces or natural laws which are not yet sufficiently known, to occupy a place in definite treatises ; nay, scientific men are the very persons most likely to admit such probability. But it is a very different affair when knavish exhibitors hoodwink and defraud the public by concocted 'manifestations.' It is also a very different affair when honest but credulous persons, witnessing something that really is worthy of investigation, allow themselves to be led into 'spiritualistic' theories of such a nature as to depart from science altogether.

'STORM WARRIORS.'

OUR rock-bound coasts and the narrow seas that wash our shores are, and always have been, proverbially fatal to the sailor. From whatever direction our islands are approached, dangers more real than the fabled Scylla and Charybdis of old yawn before the hardy mariner. On the east coast of Kent stretch the treacherous Goodwin Sands; while the Irish Channel, the cliffs of the Isle of Wight, the iron-bound shores of Wales, and the bleak coasts of Scotland, have all in turn brought death instead of welcome to many a stately ship, which has ridden out in safety the tropic hurricane, and weathered full many a mid-ocean gale, only to rush upon sudden destruction at the very threshold of home.

Many disastrous shipwrecks have occurred within a few yards of the shore; but these few yards have been such a chasm of boiling scething surf that no ordinary boat could be launched upon it and live; and the greedy breakers have engulfed their prey, with the familiar headlands, the green fields, and the pleasant homesteads of the dear old country mocking the longing gaze of those who have returned to her only to die.

To snatch if possible some victims from the angry sea, and so abate the agony of these terrible scenes of disaster and death, was originated the life-boat movement, the history of which Mr Gilmore has sketched for us with considerable ability and graphic power in his *Storm Warriors* (London: Macmillan).

The first idea of a boat which should be so constructed as to live and swim amid the stormy breakers, and in the tremendous seas which surge and boil in rough weather along our tempest-driven shores, did not, curiously enough, originate with a sailor, but with Lionel Lukin, a coach-builder of London, an obscure but none the less a true hero, who, in the seclusion of his workshop, conceived and wrought out the idea of a boat which should float upon the troubled waters of a stormy sea. In 1785 he took out a patent for his life-boat, and like most inventors, had many

difficulties to encounter and many disappointments to endure, with little to console him except a brave heart and a good conscience, and the blessedness of knowing that by means of his life-boats a few lives had been gleaned from the terrible harvest of wrecks which annually bestrew our shores.

In 1789, a short time after his death, a shipwreck occurred, which did more than all his clamorous appeals to help on the life-boat movement in which he was so deeply interested. During a violent storm at Newcastle in the September of that year, a ship called the *Adventurer* missed the entrance to the harbour, and was driven right upon a ridge of rocks outside the pier. The pier was crowded with people of every rank, and many of them, even the hardy fishermen, shed tears in the anguish of their unavailing sympathy; but they could do nothing else, and there they stood during the long hours of that fearful afternoon, watching, on the faces of the doomed men opposite to them, the ruddy hues of health blanching into the ashy whiteness of death, and listening to their agonising cries as one by one they dropped despairing into the black abyss of waters. When night closed in, all were gone; and the spectators of the pitiful tragedy went home, not to sentimentalise over what they had seen, but to endeavour as far as they could to make such an occurrence impossible in the future. A Life-boat Committee was formed, and a prize was offered for the best life-boat. The successful competitor for this prize was Henry Greathcal, a boat-builder of South Shields; and his boat, with some slight variations, remained until about 1851 the favourite model for life-boats. In 1851 the Duke of Northumberland, who was President of the National Life-boat Society, offered a prize of one hundred guineas for the best model of a life-boat. This prize was gained by James Beeching of Great Yarmouth; and his boat, after it had been still further improved by the assistant master-shipwright at the royal dockyard at Woolwich, was adopted, by the Royal National Life-boat Institution, as the model for boats of this description.

Beeching's prize-boat, which he named the

Northumberland, had meanwhile been purchased for the use of the harbour at Ramsgate, and was sent to cruise on the Goodwin Sands.

These dreaded sands, which stretch about ten miles along the east coast of Kent, owe their origin, according to an ancient tradition, to the cupidity and folly of the Abbot of St Augustine's in Canterbury, who obtained possession of them when they were taken from Earl Godwin about the year 1050. At that period they were fertile low-lying lands, protected from the sea by a wall which, like all sea-walls, required to be kept in thorough repair. The abbot was neglectful of this important point; perhaps he did not understand until too late the extreme insecurity of his new possessions; at all events he applied the funds which should have gone to the maintenance of the sea-wall, to the erection of Tenterden Steeple: it was built, and Earl Godwin's lands were lost for ever. While he was still busy about his architectural projects, the sea rushed in through a gap in the dilapidated wall, and has run riot there ever since, after a very imperious and masterful fashion.

As they partake of the nature of quicksands, it is very difficult to lay down any correct chart of the treacherous shoals and banks into which they are driven by every winter's gales, and it is almost impossible for a vessel once stranded upon any portion of them to get free. The rush of the sea is so great even in calm weather, that the wreck, instead of being floated off, works deeper with every tide into the soft oozy mass of treacherous sand, which in an incredibly short time swallows up every vestige of it. As may be expected, our wreck-chart has a fatally sad story to tell of these sands. In a frightful storm which occurred in November 1703, they engulfed a whole navy. Three line-of-battle ships of seventy guns each, with ten smaller men-of-war, were driven from their moorings and swallowed up with their crews in this abyss of sand and breakers.

It is on this dreary scene, amid a howling waste of waters whose desolation it is difficult for a landsman to conceive, that Mr Gilmore's Storm Warriors, the noble life-boat men, dare and do deeds whose high enterprise exceeds a thousandfold that of the much-vaunted knights-errant of old.

Let us imagine ourselves at midnight on the storm-tossed Goodwin; the tempest is rushing in tones of thunder along the dark bosom of the heaving sea; from time to time the fitful flash of a rocket makes the darkness more visible, and slowly feeling her way along the edge of the sands, searching for the whereabouts of the endangered ship, toils the life-boat and her crew. The struggle of wind and sea, the strife of waters, are so appalling, that it is difficult to conceive how human courage can rise to the strain; but not one heart sinks, not one strong frame quivers with even a passing thrill of fear, although here there is none of the sympathy that sustains, no admiring crowds to note the heroism that must do or die. Having once got the clue, the life-boat makes straight as an arrow to the point of the shoal where a large emigrant ship has run aground. 'How many can you carry?' the captain and pilot shout as they approach, 'for we have more than a hundred souls on board, the half of them women and children.'

'All right,' is the cheery response. 'We have a steamer behind us, and will take you off in

detachments.' With that the poor, exhausted, terror-worn passengers raise a faint cheer, and there is a sudden revulsion from despair to hope; and some who have nerved themselves to face death firmly, give way altogether at the prospect of renewed life, and shriek aloud in their strange gladness, which is almost pain; and one warm-hearted Irishwoman rushing forward, seizes the hand of the cockswain of the life-boat and wrings it, as she sobs out: 'I'll pray the Holy Father for you—I will, honey, the longest day of my life.'

Amid such fierce waves as often sweep in wild succession over the Goodwin Sands, even a life-boat is sometimes in circumstances of considerable danger. When driving in before the gale on the foaming rollers, much attention is necessary to prevent the boat broaching to, for if she did, she would in all probability be rolled over with the curl of the advancing wave, and her crew and passengers washed out of her. Again, in violent storms, although the boat may be comparatively safe while floating with the waves, there is often great danger in breasting them. One moment she is on the crest of a tremendous roller; the next she sinks into the trough of the sea, enveloped in a blinding shower of spray, and requiring the utmost vigilance and skill on the part of her crew to prevent her from turning bottom upwards. Then, when close to a wreck, many special dangers are to be met and guarded against: the boat may be carried by the force of the waves right over the wreck, or dashed against it, or get entangled in the wreckage, a contingency not unlikely to arise, particularly at night.

'Were you not frightened in the dreadful storm last night?' was the question asked of one of the Ramsgate life-boat men.

'No,' said the boatman; 'I was not. I had my inward feelings, as a man naturally must have when he is face to face with danger. I saw well enough that there was hard work before me; but by God's help, I determined to do it.'

In this spirit these men often perform deeds of individual heroism, which have been equalled but never surpassed in the annals of self-sacrifice.

One stormy evening a Dutch ship, fearfully crippled by the gale, was driven ashore on the Goodwin, where she soon became a total wreck. A very heavy sea was washing over her, and as the life-boat came up, the planks of the deck began to break and float away. The second-mate, one of the few survivors of the crew, never doubting that the last moment had come, threw himself into the sea in a paroxysm of terror, and seizing the rope by which the life-boat had just been made fast to the wreck, he tried to work himself along it; but he was weak, dispirited, and half frozen, and the breakers, as if in cruel sport, tossed and swayed him about, as they rushed over him in their mad career. Exhausted, breathless, half-dead, he was just about to drop the rope, when he was grasped by one of the life-boat men; and a long and exciting struggle began with the angry sea, which, like a ferocious wild beast, seemed loath to relinquish its prey. The fierce gale howled around them with a noise like thunder; wave after wave washed over them, each one leaping higher than its predecessor had done; and still the two men, the living and the half-dead, clung to each other with the convulsive clutch of despair. It seemed impossible to save either; and in the dark squally winter

morning a cry of horror suddenly rose from the crew of the life-boat; a new danger threatened them: between them and the storm-swept sky there suddenly hove in sight a gigantic black mass, a pile of broken timber from the wreck, which, borne along on the swift tide, was rushing full upon them. 'Sheer the boat!' they shouted simultaneously; 'port the helm!' and suiting the action to the word, she did give way a little, scarcely a hand-breadth; but it saved her; the pile of wreckage went crashing past. And these two men, where were they? Alive still! and after a few minutes more of painful suspense, both were saved.

Not infrequently the privations and hardships which they endure in the life-boat affect these strong brave men very painfully. Mr Gilmore gives us the experience of one cockswain of the *Northumberland* prize life-boat, James Hogben, a daring and hardy sailor who, prior to being appointed to the *Northumberland*, had spent the greater part of his life in cruising about the Goodwin Sands. This man was out in a fearful storm on New Year's eve some years ago, when a large ship, the *Gottenburgh*, was lost, and her crew washed from the wreck and drowned before the very eyes of the life-boat men, who, owing to some mistake, arrived upon the scene of the disaster too late to be of any use. This disappointment and the fierce inclemency of the weather were too much for Hogben: he fell seriously ill; and his nerves became so shattered, and his once brave spirit so sunk and broken, that from being as bold as a lion he became so timid that he dared not walk down Ramsgate pier lest he should tumble off into the sea.

Sometimes a life-boat will make a great many attempts to reach a wreck, and will be as often beaten back, and yet succeed in the end; so that persistency and the power of endurance are as necessary to these Storm Warriors as courage. One stormy January evening not many years ago, about half-past ten at night, the boom of a signal-gun was heard on the pier at Ramsgate, and this signal of distress was immediately succeeded by a series of rockets thrown up from the *Gull* light-ship. With all possible haste the life-boat was manned, and was towed out by a steamer in the direction of the light-ship. A careful look-out was of course kept; but the snow-showers were so blinding and incessant, that little could be seen except the broken crests of the rushing waves as they raced past them, to break in clouds of foam and spray upon the sands. The sea was very heavy, and the water from time to time came dashing over them in icy cold floods, chilling them to the very marrow of their bones. For some time they kept cruising about, but they were unable to see a yard ahead of them, and at last even their endurance gave way, and they returned to Ramsgate, which they reached about five in the morning. So great, however, was their anxiety about the wreck that they could not rest, and as soon as it was daylight they were again towed out by the steamer *Aid* in the direction of the North Sands Head light-ship. The morning was gloomy in the extreme, with a moaning wind, which gradually freshened into a gale; and at last, amid the sleet and foam, they saw in the distance a large ship aground on the south-east point of the sands. As they approached, the wind, which had been more than sufficiently high before, suddenly

swelled into a tempest, and the very spirit of the hurricane seemed about to descend on their devoted heads; a snow-squall came sweeping by, and the waves, foaming along, dashed over the boat great floods of surf and spray, till she quivered and staggered with the weight of water. It was up to the men's necks; but staunch, indomitable as bloodhounds, they clung convulsively to her for a breathless moment; the next she had cleared herself of water, and mounting elastic on a huge wave, was carried within sixty yards of the wreck, which, battered and broken, and with the crew crouching under the deck-house, presented a pitiable appearance. Full of eager excitement and hope, the life-boat men cheered loudly as they let go their anchor. 'Hold on! hold on!' shouted the cockswain in a warning voice; and a wave more tremendous than any they had yet encountered rushed forward, a huge mass of glistening green water; curling over, it broke, fell, overwhelmed, and for the moment almost stunned them. The boat plunged and tossed like some wild creature instinct with tortured life. They scarcely knew if she was still afloat, or was fast sinking; but she was their sole hope, and they clung to her with the resolute energy of despair. The next moment she righted herself, shook the water from her ruffled plumage, and buoyant as a swallow, skimmed elastic through these grim jaws of death. She was safe; but she had missed her mark; the force of the wave had carried her far past the wreck; and the crew, as they prepared for another attempt, again cheered the poor half-drowned wretches, who but a moment before accounted their last hope gone.

Hoisting the sail, they tried to run the boat right forward upon the wreck; but she reared and plunged like a fractious horse, and was tossed now in one direction now in another, until, utterly baffled and beaten, they retreated to the steamer, and were by her again towed into position. A third and fourth time they made the trial with the same result; and as they prepared for a fifth attempt, they glanced anxiously at the rigging of the wreck, where the crew had taken shelter, for it was manifest to their experienced eyes that she was breaking up fast. With almost feverish impatience the boat was got ready for what every one felt must be a last effort. Very little was said by the crew; it was a time not for words, but deeds. 'We were thoroughly warm at our work,' said one of the men afterwards; 'we felt like lions; nothing could stop us.' And with a lion-like courage they headed the boat again for the wreck, driving her sheer forward, till, with a sudden leap, she sprang upon the half-submerged vessel, and drifting over her, cast her anchor fast and firm on the deck!

Then by degrees, not without difficulty and with some hair-breadth escapes, the shipwrecked men were got on board; and the life-boat with her precious freight returned to Ramsgate, where she herself had been almost given up as lost.

Thus from year to year these Storm Warriors battle on with the howling winds and angry seas. In the dark tempestuous winter evenings, when we, who live at home at ease, draw our chairs nearer to the warm hearth, and feel our luxurious sense of comfort enhanced by the angry storm which is raging at our doors, these gallant men, scorning hardship and danger, brace themselves for deeds of heroism such as our old viking ancestors would

not have disclaimed. More enlightened than these ancient rovers of the sea, who, brave as they were, lived only to destroy, the mission of our Storm Warriors is to save, and that amid circumstances which call for the sympathy and support of all who can appreciate courage and perseverance, or feel how true and noble a thing is noble work simply and manfully done.

It only remains for us to add that those who may be wishful to aid in the good cause can do so by forwarding their subscription to the Royal National Life-boat Institution.*

Speed the life-boat!

INDISCRIMINATE ACQUAINTANCES.

IN TWO CHAPTERS.—CHAPTER II.

WHEN we came to explain matters, though the Peerage was a great help to us, still we could not but admit that, except from his own account, we knew very little; certainly not enough to satisfy our father, who expressed in no measured terms his disapproval of picked-up acquaintances.

'He may be very nice, and I daresay he is,' said my father; 'but I am not going to let you girls make friends that I don't know something of myself.'

'I think you are quite right, Edward,' put in mamma. 'It was through Mrs Devereux that we really got to know him, and I have not quite cared myself for the intimacy; though I must say Colonel Gore is a most agreeable man and quite a gentleman.'

'Perhaps so,' answered our father with ominous brevity.

I stole a glance at Nora during the conversation, and noticed that she grew very pale as it proceeded; paler still when shortly afterwards it was settled that we had had enough of sea-breezes, and were to return to King's Court on the following week.

Colonel Gore still lingered; but, to our surprise—mine at least—he ceased his marked attentions to our party from the time of our father's arrival. He was introduced to him, and failed to impress him as favourably as he had done the rest of the family; in fact, the latter made no secret of his aversion to him, to which we all listened with very mingled feelings.

'He can't look you in the face,' said my father; 'there's a shifty look about him.'

Florence indulged in a quiet sneer at this remark, unobserved as she imagined; but my mother caught sight of it, and said—very sharply for her: 'I don't know what you are laughing at, Florence.'

'Oh, at the idea,' responded Florence—'at the very idea of Uncle Edward's thinking Colonel Gore couldn't look him in the face—a man in his position. Why, he might marry a duke's daughter.'

'No one was talking of marrying,' interrupted my father.

'O no!' assented Florence; 'but I thought you didn't think him good enough to associate with. A baron's son, the colonel of a hussar regiment—such a thorough gentleman.'

'I don't care what he is,' replied my father; 'but I don't choose my daughters to make acquaintances indiscriminately.'

Then the subject dropped, and that night we passed Colonel Gore on the Spa—a distant inclination from my father being all the acknowledgment bestowed upon him. It was evident from the very first that our father regarded him with dislike and mistrust; we all felt that, and I wondered what Nora in particular thought about it; I could not forget the gala night, though she apparently had done so. I never questioned her again, partly because just then a slight shade seemed to have come between us. She and Florence were constantly closeted together; whilst Emmy and I were most palpably *de trop* if we ever attempted the faintest interruption of their conferences. However, the evening preceding our departure from Scarborough, Nora was nicer and kinder than she had been to me for some time. She was not usually very demonstrative, so it surprised me when, as we were dressing to go out, she suddenly threw her arms round my neck, and began to sob almost hysterically.

'What is it, Nora? Dear Nora, what is the matter?' I asked in great anxiety.

'Nothing—nothing,' she answered, calming herself with evident difficulty, and drying her streaming eyes; 'I'm only very silly—don't tell, Esme; but promise me one thing, always to love me.'

'To love you, Nora!' I echoed, mystified at the request; 'I always loved you. Aren't you my own sister?'

'Yes, O yes; but you won't forget, Esme. You'll always remember I am—your—own—sister.'

'Always,' I answered emphatically, snatching up my gloves and hurrying down-stairs to join the others, slowly followed by Nora.

It was a very sultry evening; it would have been oppressive, but for the cool delicious air off the tranquil sea. We all sat listening—a happy family party—to the monotone of the waves as they washed gently up in endless succession—long after the band had ceased playing, and the fashionable loungers had repaired to their respective hotels.

'How delightful it is!' said Emmy; 'I should like to stay out all night.'

'I'm sure I shouldn't,' responded Florence; 'I infinitely prefer a comfortable bed to sitting staring at the sea.'

Her unappreciative remark reminded my mother of the lateness of the hour, for she said immediately: 'It is late, but it is your last look, girls; we shall be at King's Court to-morrow.'

'Dear old King's Court!' cried Emmy; 'I'm never sorry to be there.'

'Nor am I,' I agreed.

But Nora never spoke.

We moved homewards slowly—Nora and Florence rather lingering behind, whilst mamma, Emmy, and I preceded them.

Our father had returned to King's Court before us, so these last few days at Scarborough we had been without him; but Colonel Gore had not apparently taken any advantage of his departure. He was offended, no doubt, at the reception he had met with at the first introduction. So it was probable that after all his intimacy with us, he would leave without saying good-by.

I have often wondered at the sort of intuitive presentiment I had that night of coming evil; I could not shake it off, try as I might. It was

* Richard Lewis, Secretary, Royal National Life-boat Institution, 14 John Street, Adelphi, London.

almost a relief to me when Emmy, who shared a bedroom with me, tried to account for the depression and restlessness that oppressed me, by attributing it to the thunder, which, from the extreme heat and stillness of the atmosphere, we felt certain could not be far off. At midnight it came—the low, rolling peals, preceded by vivid flashes illuminating our room in quick succession, that frightened us all, and caused the very house to shake. But ere the storm ended I fell asleep, and the sun was shining brightly when I awoke. Some one was standing by our bed, in whom it required no second glance to recognise our mother.

'Children,' she was saying, 'O children, wake up and find her! I don't remember how she gasped out her dreadful discovery—but Nora was gone.'

All was confusion, dismay, and horror. Florence only retained her calmness, and was just then a wonderful assistance and comfort—for we never guessed the part she had taken in the affair. She it was who telegraphed to my father—she, who reasoned mamma into almost tranquillity, by representing in most glowing terms, the very worst side, as she phrased it, of Nora's elopement.

Lord Raymond probably had very high views for his son, and Colonel Gore doubtless had made certain that Nora's parents would be averse to her entering a family where just at first she might not be quite welcome; but once married, the only son and heir must of necessity be forgiven; and if the future Lady Raymond had been slightly imprudent, why, her wealth and position precluded the possibility of unpleasant remarks being made. Her next letter would be from Portman Square—for poor Nora had written a few blotted lines to implore forgiveness, and to tell us that by the time we received it she would be Gerald's wife.

Never shall I forget my father's face when he arrived—he looked ten years older; his voice was harsh, changed, and terrible when he walked in—taking no notice of any of us, but addressing our mother, demanded to be told all and everything with regard to this overwhelming disgrace.

'Leave the room—all of you,' he said, waving his hand towards us, and we trooped out—Emmy and I weeping, while Florence retired to pack up her multitudinous dresses, preparatory to bidding us all good-by.

We left Scarborough that afternoon, and returned to King's Court with our mother, whilst our father hurried to London in quest of the fugitives—his errand not being made less anxious by having discovered that the Honourable Gerald had left a gawdy bill behind him to which there was not much chance of a receipt stamp being affixed. Such conduct had aroused a terrible doubt in his mind, for it seemed incredible that, so notoriously wealthy as Lord Raymond was, he should have kept his son so short of funds; and as usual, when once the ball of inquiry was set rolling, as is always the case it gathered as it went. He had borrowed right and left—even Mrs Devereux bawled a ten-pound note, which, however, was but a trifle in comparison to the other sums she had from time to time willingly 'lent' to this 'unmistakable gentleman' and scion of an ancient house.

We never heard where our father found them; in fact, when he returned, crushed and grieved-looking, none of us ventured to ask, and what passed between him and mamma was in the privacy of his study. We were only to be told

that Nora was married. She had disgraced her family, and we were sternly desired never to mention her name in his presence again. More than that, she was to cease to be regarded as our sister—we were to forget that we ever had a sister Nora.

What a change fell upon King's Court after that terrible sojourn at Scarborough! How we mourned for the absent one, and how Emmy and I used to sit for hours together whispering our wonderments—our woe at the sudden and total loss of our bright pretty sister.

'Papa will forgive her some day, Emmy,' I said, 'when she is Lady Raymond, and then she will come back to us dearer and sweeter than ever. How she must long to see us all again!'

'I was dreaming about her last night,' answered Emmy; 'such a dreadful dream. I dreamt I saw her standing on a bridge, Esné; it was only a narrow wooden one, and it was over a rapid rushing river; she was beckoning to me, and I tried to reach her, for I saw the bridge was bending; when suddenly it gave way, and the next thing I saw was Nora struggling, oh! so pitifully; but she was swept away,' concluded Emmy with a sob.

At last we heard the story why our father's grief and anguish had been so great, and why Nora's name had been forbidden to be uttered before him—for she had been deceived. Poor Nora. She had married not the Honourable Gerald Gore, but a needy adventurer, a base unscrupulous scoundrel who, under cover of another man's name, had foisted himself upon a credulous coterie, who had, strange as it now appears to us, accepted him upon his own representations and believed in him to the last.

To marry the eldest daughter of so rich a man as Mr Haughton of King's Court had suggested itself to him as an easy way of getting out of difficulties with which not even his astuteness could contend; and favoured by Florence's belief in his nobility, riches, and desirableness altogether, he had succeeded not only in winning Nora's heart, but in persuading her to take the fatal step of running away—urging upon both her and Florence the arguments advanced by the latter to us when the first discovery was made—namely, that his father had such exalted views for him, it would be utterly useless to ask his consent until the knot was tied which no man could unloose.

Nora had wavered—had faltered—half drawn back; then tremblingly promised; for the innocent unsophisticated girl was no match for the ruthless spider into whose web she had walked. She loved him, trusted him, and deserted her happy home for him.

Terrible had been the reckoning with my father that the impostor, Vincent Knowles, had to pay; and what Nora must have felt on the discovery of his falsehood no one ever knew. She was his wife, whether as Gerald Gore or Vincent Knowles; and being his wife, ceased to be her father's daughter. Not that she should want, for an allowance far beyond what Mr Knowles had dared to hope for was to be regularly paid her; but there it ended, and for her sisters' sake she was to be an alien. And when first the fiat had gone forth, she heard it with something like calmness—having him, it was not such a death-blow.

We must hope he was kind to her at first, that at least a brief season of happiness followed. We

fancied she must be happy—reconciled to being estranged from us all—for she never wrote; not a line reached King's Court in the well-remembered characters. She was satisfied, and by degrees—for time is a wonderful healer—we became used to her absence.

So two years passed away. It was a stormy night in December; the elements seemed to be waging war with themselves in a struggle between snow and rain, and the wind was howling in dreary mournfulness through the leafless lime-trees. Nothing could have been more desolate than the prospect from the library window, where I had been standing looking out until the servant came to close the shutters, draw the curtains, and shut out the wretched scene. We had no cause to remember it, sitting down to a comfortable dinner with every appliance of luxury and refinement; yet we almost shuddered as those splashing torrents came dashing up against the windows. It was not a night for any human being to be out, and yet, toiling up the avenue, thinly clad, and with weak uncertain footsteps, there was a slight girlish figure. Drenched and trembling, she reached the porch; with all the little strength she had she rang the bell; a sharp short peal it was, which sounded clearly through the tempest. 'Who could it be at this time of night?' thought we, as Davis our old butler opened the door cautiously. He only saw that it was a woman, who neither pausing, nor parleying, slipped past him; on—on—nor stopped until she had gained the dining-room, thrown herself at my father's feet, and with a wild cry of 'Save me! O save me!' fainted in his arms.

Was that pale, inanimate, lifeless object Nora? Was that strangely clad, soaked, poverty-stricken being our once bright pretty pet?

Yes, it was Nora. Nora, who had a terrible tale to tell, which, but for a brain-fever that followed, would probably never have been revealed to us—of neglect, violence and cruelty, of coldness and indifference, followed by still worse. He had never cared for her, and she had written to us times without number; but knowing the result of his behaviour coming to my father's knowledge, he had taken care that none of her letters ever found their way to a post-office. He had tired of her, and tired of paying his hirelings to keep watch and ward; so when Nora, goaded to desperation, had threatened to return home, he took measures to place her where she had languished for twelve terrible months in a private lunatic asylum. Aided by the humanity of one of the nurses, Nora at last effected her escape, and succeeded in reaching her old home just when life itself seemed leaving her.

Vincent Knowles had been duly informed of her escape, and dreading the vengeance he well knew would overtake him, he embarked on board an outward-bound vessel, intending, no doubt, when the right time came, to return, and again torture his unhappy victim. But the day of reckoning had arrived. In sight of land, a few hours after leaving the shores of England, the vessel sank, and amidst the numbers that sank with her, to rise no more until the morning of the resurrection, was Vincent Knowles. Happy release for poor Nora, whom we nursed by day and night with all the tenderness that could be lavished; but all in vain. When the primroses and the snowdrops were blooming, Nora faded, and we laid her to rest with them blossoming above her.

Three things, we think, may be learned from her sad history; and to lay them to heart may save sorrow in families as happy as ours was when darkened by the shadow of a bad man. Firstly, that nothing can ever justify a parent in forsaking a child. Secondly, that a girl may always know, when tempted to deceive her parents, that the tempter is a villain. Thirdly, that never under any circumstances is it wise to admit into friendly intimacy indiscriminate acquaintances, no matter how agreeable; for though all may not be like Vincent Knowles, the wisdom of the rule cannot be doubted. Beware of Indiscriminate Acquaintances.

THE LORD MAYOR OF LONDON.

HIS PAGEANT AND BANQUET.

OF the pageants through the City of London other than that which takes place when the great dignitary enters formally on his year of office, we do not propose to treat.

In accordance with the early royal stipulation, the new Mayor must be presented for approval to the king or his chief judge; and as the successive sovereigns have held their court and the judges sat in Westminster, a journey thither had to be annually made from the City of London. These journeys were called *ridings*, as most of the personages went on horseback; and splendid affairs they usually were, quite eclipsing the 'show' with which we are now familiar. Sometimes a water procession was substituted for, or added to, a riding by land. The great City Companies hired barges for the occasion, and continued to do so until 1636, when the Grocers ordered 'a fair and large barge for the use of this Company' to be built, with 'a house and place for the safe keeping of said barge.' The other chief Companies were not slow in following the example; and thus was gradually formed a splendid array of state barges, headed by one of extra magnificence for the great man himself.

Hall's *Chronicle* tells us that, on one Lord Mayor's Day in the early Tudor times, the water procession on the Thames was led off by a barge containing 'a great dragon continually moving and casting wild-fire, and round about stood terrible monsters and wild men casting fire and making hideous noises.' Then came the Mayor's barge, garnished with many goodly banners and streamers, and richly covered; in which barge 'were shalmes, shagbushes (shawms and sackbuts?), and divers other instruments, which continually made goodly harmony.' Next came the gaily adorned barges of the Haberdashers, Mercers, Grocers, and other Companies, 'some garnished with silk, and some with arras and rich carpets.' The land-pageant often introduced practical punning allusions to the surname of the Mayor—such as Wells, Webb, and Lemon. A special example of this was displayed in the year when Alderman Wells was Mayor; three wells running with wine were exhibited at the Conduit in Cheapside, tended by three maidens representing Mercy, Grace, and Pity, who gave wine to all comers; the wells were surrounded by trees laden with oranges, almonds,

lemons, dates, &c., in allusion to the Mayor's trade as a grocer. (In the days when tea and coffee were unknown in England, the Grocers were merchants who dealt principally in foreign fruits and spices.) In 1566, Sir William Draper's show or pageant was such as would strike a modern Londoner with wonderment. The procession was headed by six boys, 'singing and pronouncing speeches'; forty-six bachelors in gowns trimmed with marten fur, and having crimson satin hoods; twenty-eight 'whifflers,' to clear the way; forty-eight men bearing wax torches an ell in length; an equal number armed with javelins; and two fancifully dressed semi-savage 'woodmen,' carrying clubs and letting off squibs to clear the way—after which came the main personages of the procession, on richly caparisoned horses. Men 'apparelled like devils, and wilde men with squibs,' took part in one show in the time of Elizabeth. Standard-bearers, drummers, fifers, bedesmen, pikemen, trumpeters, waits, bachelors, whifflers—all are named among the gay processionists in that century. (Bachelors and Whifflers were two grades among the freemen of the several Companies.) The City giants were set up in Guildhall at least as far back as the Tudor times; for in 1558 we read of 'the two ymages of Gotunagog the Albione and Corineus the Britaine, two gyantes bigge in stature.' The old Gog and Magog were destroyed in the Great Fire of 1666; and a new pair carved by Richard Saunders a few years afterwards. On some occasions the grim monsters have been carried in the procession.

The citizens relished these shows too heartily to permit them to die out. At one time we hear of groups of children representing London, Magnanimity, Loyalty, the Soldier, the Sailor; at another, of four Nymphs, each of whom addressed the Mayor in a short speech; at another, of Astræa (supposed to represent Queen Elizabeth) attending with her flock at the Fountain of Truth, defying Superstition and Ignorance. There were, in one year or another, sea-chariots on the Thames, with Neptune to address His Worshipful on his way to Westminster; islands drawn on wheels through the streets, with trees bearing fruit; Jason and Medea bearing the golden fleece in the ship *Argo*; the Chariot of Man's Life, with allegories of the successive periods of man's career; London and her twelve Daughters, representing the twelve Great Companies; the Mayor, Neptune, and Thamesia, attended by eight 'royal virtues'; a fishing-boat, with fishers drawing up their nets laden with real fish, and distributing them to the people; Mermen and Mermaids drawing an Angel of Victory; Bacchus rowed in a galleon by Bacchanals; Satyrs carousing in an Arbour of Delight; a King of the Moors attended by six tributary kings—in short, there was an amount of figurative, emblematical, symbolic imagery which our prosaic age can barely comprehend. The usual arrangement adopted was for each Company to provide the pageant on the mayoralty of one of its members, and to adopt allegorical tableaux associated with its trade. The Grocers were greatly distinguished in this matter; on one occasion they had an Island of Spices, with two mounted orientals distributing sugar, dates, nutmegs, and ginger to the populace.

Royal personages not unfrequently witnessed the civic displays. In six consecutive years Charles II. was provided with a cushioned and

curtained balcony in Cheapside, and afterwards dined with the Lord Mayor in Guildhall. Hogarth's picture of the Lord Mayor's Show, painted about the middle of the last century, depicts the Prince and Princess of Wales seated beneath a canopy at the end of Paternoster Row. The picture in other respects conveys an excellent idea of the show and its incidents—the genteel spectators accommodated on raised and inclosed seats; the general public in the roadway; the raised stands of the Companies along Cheapside; the windows and house-tops filled with gazers; the bedizened coach with its footmen; the liverymen clustered in their several guilds; the City militia, the men in armour, and the flaunting flags and banners. The allegorical pageantry had pretty well worn itself out by the time of Queen Anne; but it was revived for a special occasion in 1761, when George III. and Queen Charlotte dined with the corporation on the first Lord Mayor's Day after the royal marriage and coronation. The Armourers, Braziers, Skinners, and Fishmongers came out in great force on this auspicious day with symbolical archers, men in armour, fur-dressed Indians, dolphins, mermaids, and sea-horses.

The Lord Mayor always rode on horseback in the procession until 1712, Sir Gilbert Heathcoat's year of mayoralty. The equestrianism has since been occasionally exhibited, but not on Lord Mayor's Day. Alderman Sir Claudius Hunter was rather proud of his horsemanship, and liked to ride about the City on a white steed. Hence arose an epigram:

An emperor of Rome, who was famous of whim,
A Consul his horse did declare;
The City of London, to imitate him,
Of a Hunter has made a Lord Mayor.

On Thanksgiving Day 1872, the Lord Mayor and nineteen other civic dignitaries appeared in equestrian array to receive the royal party at Temple Bar—not, it is said, without some indications of 'unstable equilibrium.'

The Lord Mayor's first official coach was a modest affair. The present enormous, heavy, gorgeous vehicle has done duty for nearly a hundred and twenty years, and is certainly the most unique object in the show; its panels were painted by Cipriani, and its total cost exceeded a thousand guineas. With very few exceptions indeed, the state coach on this eventful day has been honoured with the presence of the Lord Mayor decked with his insignia of office, his two chaplains, his sword-bearer, carrying the pearl sword presented to the City by Queen Elizabeth, and his mace-bearer, carrying the gold mace presented by Charles II.

Modern attempts to revive the old allegorical pageants have not had much success. In 1811, Alderman Sir Claudius Hunter as Lord Mayor borrowed two beautiful suits of armour, one brass and the other steel, for which Mr Ellistou had paid five hundred pounds, and which were to be used in a grand spectacle at the Surrey Theatre; and John Kemble undertook to provide nodding plumes for the neighing steeds. The steeds were probably borrowed from the theatre, or were trumpeters' chargers from the Horse-guards. In 1822 there were three knights in armour, attended by three esquires in half-armour, heralds, and banner-bearers. The year 1825 presented the diversity of one knight

in copper armour, one in brass chain-mail, one in brass scale-armour, and two in steel and brass armour. In 1837, when Alderman Cowan was Lord Mayor, two colossal figures walked as Gog and Magog; they were fourteen feet high, and a man walked inside each. In 1841, Alderman Pirie's year of mayoralty, a ship fully rigged, and manned with boys from the Royal Naval School, formed a conspicuous object in the procession. In 1853, Alderman Sidney's year, Astley's Amphitheatre was appealed to for the furnishing of a Chariot of Justice, drawn by six horses; mounted standard-bearers of all nations; gold-diggers figuratively engaged in washing quartz (the Australian gold-fever had just set in); implements of industry in emblematical array; and a car with a throne, a terrestrial globe, and two fair women (from Astley's) personating Peace and Prosperity. In 1865, Alderman Phillips's year, armour was used in the procession; and a singular mixture of the modern with the mediæval was presented in one item of the day's expenses: 'Messrs Pickford, for cartage of armour, forty pounds.' Six men in glittering armour, with lances and pennons, figured in last year's pageant; but somehow the modern uniforms of a dozen or so of military bands, and other modern elements in the procession, clashed with this bit of chivalric revivalism. It may even be surmised that those young wags the boys of London irreverently quizzed the gallant knights, and hinted at the possibility of some of them tumbling off their chargers.

Lord Mayor's Day is a severe one for his Lordship. If he eats whenever viands are set before him, his digestion must be somewhat severely taxed; but he bears in mind that he will have to propose many toasts in the evening, in the presence of many distinguished guests. Whatever quiet family breakfast he partakes of, he joins many of the corporate officers in another breakfast in one of the council-rooms. Some little time afterwards a substantial luncheon is served, at which the new Lord Mayor makes his first appearance in his official robes with his array of officers around him. Meanwhile the procession is being organised out of doors; workmen as thick as bees are finishing the carpentry, upholstery, and decorations within and without Guildhall, and always belie the predictions of lookers-on that the work cannot possibly be finished by the evening. A Guildhall banquet to a specially great personage—Queen Victoria in 1837, the Emperor and Empress of the French in 1855, the Sultan of Turkey in 1867, the Shah of Persia in 1873, the Czar of Russia in 1874, for example—is additionally gorgeous; but the annual display on the 9th of November is admitted on all hands to be a splendid affair.

Of the procession as now usually conducted, we need say little; the newspapers tell their readers all about it on the following morning. The Lord Mayor generally manages that the procession shall traverse some part of the ward of which he is alderman, or pass in front of the hall of the Company to which he belongs, or in front of his own shop or warehouse: one or other of these feats is usually accomplished; but the achievement is not an easy one, owing to the narrowness of all except a few streets in the City of London. The most lumbering thing in the procession is the big over-adorned coach, which is said to cost a considerable sum for repairs every time of using. Some years

ago a Lord Mayor set aside this vehicle and rode in another; but this disregard of tradition was too much; the citizen sight-seers were dissatisfied, and the gilded coach made its reappearance next year. By far the most elegant part of the whole affair is the cortege of the two sheriffs; nothing in Europe can excel the carriages, horses, trappings, and liveries, in real excellence. The corporate officers mostly ride in their own carriages, as do the chief members of the great Companies. The military bands, the flag and banner bearers, the brave knights in armour (if any) are paid for their services; and bell-ringers are paid for ringing out joyous peals from about a dozen church steeples.

Where all the component elements of the procession stow themselves, during the introductions and ceremonial in Westminster Hall, is a mystery which only the metropolitan police can solve; but all being ready for the return to Guildhall, the procession is re-marshalled. And now it is that the Queen of the City first makes her public appearance. The Lady Mayoress joins the procession on its return; her elegant dress-carriage, her maids of honour, and her flashing diamonds give a grace to the display which it before wanted. The drums beat and the trumpets blare; the banners again display their gold and silver on coloured silk, and some of Her Majesty's cavalry help to make up the scene. It is generally dusk, in murky November, when the procession reaches Guildhall; and everybody is pretty well tired.

But the evening is an important one; and the Lord Mayor and Lady Mayoress must be ready to receive their distinguished guests. The Cabinet Ministers are invited, and attend in court dresses; as do ambassadors in the state dress of their own court; military and naval officers are in full uniform; judges in their scarlet gowns, flowing wigs, and square black caps; prelates in more sober garb; and certain gentlemen in dress-suits of black velvet. Grace being said, all sit down; and we may reasonably suppose that nearly a thousand persons cause the disappearance of a formidable quantity of savoury viands. The bill of fare does not differ much from year to year. Let us look at one of them: 250 turkeys of real turtle, 6 dishes of fish, 80 roast turkeys, 60 roast pullets, 60 dishes of fowls, 40 of capons, 80 pheasants, 24 geese, 40 dishes of partridges, 15 dishes of wild-fowl, 2 barons of beef, 3 rounds of beef, 2 stewed rumps of beef, 12 sirloins and ribs of beef, 2 quarters of lamb, 30 entrées, 50 French pies, 60 pigeon-pies, 53 ornamented hams, 43 tongues, 60 dishes of potatoes, 6 of asparagus, 50 dishes of shell-fish, 60 dishes of mince-pies, 50 blanchmanges, 40 dishes of creamed tarts, 400 jellies and ice-creams, 100 pine-apples, 120 dishes of cakes, 200 dishes of hothouse grapes, 350 dishes of other fruits—besides wines in liberal variety. An inequality in some of these items is due to the fact that on the day, where the great personages are seated, the dinner is hot, served with great completeness; whereas the tables in the body of the hall, for the less distinguished guests, are mostly laden with cold viands—except the all-important turtle, which is hot.

It is during dessert that the healths are drunk and the speeches delivered. This is not the least remarkable feature of the proceedings; for the Lord Mayor, whatever may be the political party

(if any) to which he himself belongs, invariably invites Her Majesty's Ministers, and pays them handsome compliments on proposing their healths. The Prime Minister for the time being is nearly always present; and sometimes he avails himself of this opportunity (just midway between the past and the forthcoming sessions of parliament) to give an exposition of government policy. If the several speakers have the gift of humour, so much the better: their speeches accord better with the wine and dessert. Never does a distinguished guest (sometimes a royal prince) neglect to propose the health of the Lady Mayoress, and never does he forget to use the language of graceful gallantry in so doing.

Does the Lord Mayor get up with a headache on the 10th of November, after the luxuries and excitements of the preceding day? He had better not; for the duties of his office press upon him from the outset—commencing, it may be, with the hearing of police cases arising out of the street sight-seeing of the previous day. Now the Lord Mayor attends to his own business as a manufacturer, merchant, or shopkeeper, during his year of office, the public are not told; in all probability, other partners in the firm take the burden off his shoulders. Few of them wish for a second year of office, even if the citizens were willing to confer it; for the honour is costly as well as laborious. Should, however, any special royal reception take place during the year, the Lord Mayor has a fair chance of knighthood; and then he is 'Sir' for the rest of his life. Should the occasion be *very* special, he is made a Baronet, with succession to his descendants—much to the gratification of 'My Lady,' of course. When the Lord Mayor is made a baronet, the sheriffs are generally knighted. Thus it has arisen that among the present aldermen of the City of London who have 'passed the chair,' four are baronets and seven knights.

As London in its widest acceptation is the largest and wealthiest metropolis in the world, so is London in its City limits of about one square mile the most remarkable of all for its corporate privileges, trade guilds, and civic splendour.

SENSATIONAL GYMNASTICS AND ACROBATISM.

A FEW months ago an accident happened in view of a Dublin audience, to a (supposed) female performer on the *trapeze*; she missed her hold, and was dashed against the ground with considerable force. Nor was the matter much mended when, a day or two after, a letter appeared in the papers, written by her or in her name, stating that it was *only* by the failure of a spring-board that the accident occurred, that she was *only* bruised, and that she hoped soon to reappear before her patrons the public!

Apart from considerations as to the propriety of such an exhibition as this, the question is, Who is to blame here? There are multitudes of persons in humble life not brought up to any regular trade, or influenced by unsettled habits, who seek to earn a living as public exhibitors. Tumbling, posturing, vaulting, somersaulting, rope-walking, rope-awigging, pole-balancing, trapeze-flying, lion-taming, all have more or less of danger attending them. And herein lies the evil. The public, or a considerable section of the public,

evinces a relish for witnessing feats which have in them an element of peril. The consequence of this may be easily traced. If people prefer the sensational to the graceful and elegant, they attend in greater number; the speculator or proprietor of the exhibition takes more money at the doors; he offers a higher salary to the performer, and the latter is thus tempted to try more and more dangerous and daring feats. It would be better if these matters could be regulated by the good sense of the public than by legislative or governmental interference; but so long as the taste of sight-seers has a leaning towards hair-breadth escapes, so long will there be a succession of exhibitors and performers ready to make money out of it.

The danger attending trapeze feats can easily be understood. Two ropes are suspended vertically, and two horizontal bars are fastened to them, one above another. The performer usually springs up, catches hold of the lower bar, and achieves various acrobatic twistings and turnings, now on his head, now hanging by one foot, now twisting like an eel between the upper and lower bars, now dropping head foremost from the upper bar to the lower. Any slip of hand or foot, and down he falls. Some years ago in London a man combined this acrobaticism with aërostation. He ascended in a balloon, and when at a height measured by hundreds of feet, went through a series of performances on a trapeze suspended under the car. Whether the height were hundreds or thousands mattered little to him; a fall would dash him to pieces in either case. The proprietor of the gardens received a larger number of shillings or sixpences on this occasion than if an ordinary balloon ascent only had been announced; and thus a trapeze performer was tempted to hazard his life by the receipt of an additional fee. An increase of peril occurs when two trapezes are suspended many feet or even yards apart; the acrobat swings or takes a flying leap from the one to the other, losing hold of the one and afterwards seizing the bar of the other. The slightest miscalculation of distance may be fatal. Léotard, the hero of this kind of achievement, performed the feat on five or six trapezes in succession, turning a somersault between each two. He was amazingly successful in a commercial sense, receiving a high salary. Mark the consequences; imitative Léotards have been numerous, and many a broken limb or life-injury has resulted. (We may here remark, in parenthesis, that a clever 'Antoninon Léotard' was exhibited at the Polytechnic Institution a few years ago; a life-size figure that performed in a neat and complete way many of the tumblings of a trapeze performer—those in which the hands do *not* quit hold of the bar; and latterly we have witnessed the pleasing performance of Heller's antonaton trapezist, which hangs by its feet as well as by the hands.)

Walking head downwards is another of these fool-hardy displays. The ceiling, prepared for this exhibition, is provided with grooves, slides, or springs, barely perceptible to the audience, but sufficient to give a hold for an instant to a peculiarly shaped boot; the performer is suspended from one foot while he thrusts out the other to catch hold of the groove or spring; and thus laboriously wends his way onward, step after step. If he fails to insert one foot before freeing the other, we know the inevitable result. In one exhibition, several

brass rings were suspended in a circle, and the performer made his way from one to another, holding on by hands or by feet as the case might be. A netting, spread out some distance under him, or soft mattresses placed on the ground, lessened the probability of broken bones; but the very provision of such precaution sufficiently shews that peril is known to be involved. (It may here be remarked that there was a netting some distance below the trapezist to whom the accident lately happened; but it failed in its intended service, and she (or he) fell heavily twenty or thirty feet to the ground.)

Tight-rope walking is one of those achievements in which the slightest mishap of footstep, the slightest failure of nerve, brings the gymnast to grief. The famous Blondin eclipses all other exhibitors in this line. The baskets on his feet, the blindfolded eyes, the wheelbarrow trundled before him, the chair, the table set out with refreshments, all balanced on a stretched horizontal rope—these are marvels indeed. It shews what a morbid state of feeling, however, is engendered by this exhibition, when Blondin pretends to miss his foot-hold once now and then, and regains it after quivering movements of the body and limbs, in order to send a thrill of terror through the spectators! One of his achievements is to carry Madame Blondin while he walks his thousand feet or so of rope; but this has been found too much for English taste to bear, and it is not included in his regular programme. The veteran may possibly be so completely void of bodily fear and nervous trepidation as to be nearly as safe on the rope as on the ground, and may die a quiet natural death when his course is run. But his example has not been without evil effect. There have been and still are 'English Blondins,' 'Female Blondins,' and 'Juvenile Blondins,' who imitate some of the perilous exploits as a means of earning a livelihood; many and many a limb has been shattered, or neck broken, in consequence. In the days of our fathers, or perhaps grandfathers, one Madame Saqui obtained great notoriety for her achievements on the tight-rope; if we remember rightly, her career was cut short by a frightful accident; but whether so or not, it is certain that a 'Female Blondin' only a few weeks ago came down with a crash while attempting to cross the auditorium of a theatre on a rope—with what result we need not say.

The slack-rope has its heroes and heroines as well as the tight-rope—and its victims also. Why the performer does not fall off, while sitting on the rope in full swing, with arms folded, and no hold or grasp by the hand, is a mystery and marvel to many of the audience; and the greater the marvel the greater the attractiveness—according to the logic of showmen and exhibitors. The fact is that the performer is familiar with a law of dynamics without knowing or caring about its scientific meaning: a law which tells him that he must incline his body backward during the onward swing of the rope, and forward during its reverse swing. A wonderful exhibitor appeared amongst us many years ago, though not so many as to be beyond the recollection of some of us: an Italian or Spaniard who chose to assume the professional title of 'Il Diavolo Antonio.' His slack-rope swinging was daring beyond precedent, and he had few followers who could equal him. The pendulum movement

of his body during the full swing of the rope was in a curve of very wide sweep. While sitting on the rope in sweeping oscillation, he would tie his right ankle to it with a piece of cord half a yard or so in length; then, when at the utmost extremity of his onward course, he would fling himself from the rope, and hang head downwards, attached to the rope by one ankle only; assuming very nearly the traditional attitude of 'Faune blowing the trumpet,' he played on a horn or bugle, accompanying the orchestra in the 'overture to *Lodoiska*,' with his head farther from the rope than any part of his body and limbs, and consequently swinging in a greater arc than even the rope itself. What applause! What a thrill of excitement! What a fascinating horror at the supposition of the cord breaking or the ankle-fastening becoming loose! But look a little behind the scenes. Many a coroner's inquest has recorded the dismal end of some or other of these rope-swingers; poor mangled creatures who have died in giving 'pleasure' to others. We must 'take the gilt off the gingerbread' before we can rightly estimate these things.

Circus-riding, when kept within moderate limits, is often very elegant. It illustrates two scientific principles that are ever operative in such exhibitions. One is, that the horse and his rider must both incline the body towards the centre of the ring, else the centrifugal force of the circular motion would soon bring them to trouble, pitching one or both at a tangent over among the spectators; and the higher the speed the greater must be the angle of this inclination. The other is, that the rider, standing on the horse, may leap up and down in various ways, and may jump over bars and shawls, or through hoops or casks, and yet alight upon the horse again although in a gallop. This is because the rider partakes of the onward motion of the horse, and is really moving on when he seems to be only jumping up. But oh, the falls, bruises, and disasters that have to be encountered before the smiling, be-rugged, tinselled performers are fitted to make their bow or courtesy to the public! An 'Ella,' or an 'Elise,' or an 'Angelioue' has to pass through a wearisome, long-continued, prosaic discipline before she can appear as a fascinating *equestrienne*, jumping through hoops of fire, or dancing in a *pas de deux* with a male performer on two horses. How many broken limbs occur during the apprenticeship, the public never know; the 'profession' does not talk of those things; but Mr Frost, who has written some singularly curious books about showmen, circus-riders, and other public performers, has much to tell concerning the ordeal which such persons have to undergo—the fractures, the bruises, the heartaches, the poverty, the disappointments, too often ending in untimely death. It is noticeable, he remarks, that they are mostly quiet people in private life—rather serious than 'jolly,' and very little prone to drinking. The necessity for maintaining keen eyesight and steady nerves, in an occupation naturally perilous day after day, makes a man cautious against 'putting an enemy in his mouth to steal away his brains.' Perhaps it is an effect of reaction that those who earn a living by making others laugh are often melancholy rather than gay when removed from the glare of stage-lights. Such was Liston, and such was Grimaldi. When the performance is intended to excite wonder at feats of peril, there is an additional reason why

the performer should be anxious, careful, often foreboding.

Lion-tamers, men who dally with the animals in a menagerie in make-believe play, are special examples of sensational heroism. When a man lies down in a den among lions or tigers, opening the mouth of one, leaning upon another, taking the huge paw of a third, and ending by putting his head into the opened mouth of a fourth, he does one of two things—he either shows what a poor spiritless thing a lion becomes when under the discipline of fear, or he exposes himself to danger of a most horrible kind. What those men go through before they have trained themselves and tamed the animals up to the required point, can be known only to themselves; but it is known that moments of agony fall to their lot when spectators are wondering and applauding; some movement on the part of a caged animal, some look of the glaring eye, tells the experienced exhibitor that it is a mere toss-up (to use a homely phrase) whether a fatal catastrophe is imminent. In the days of Van Amburgh, the most famous of all 'lion-kings,' it used to be said that one visitor attended the exhibition night after night, fearing lest he should be absent when the final scene of the 'king' being torn to pieces should occur. The story may have been an exaggeration; but there can be no doubt that the feeling excited by such an exhibition is a morbid one. Of the Spanish bull-fights we will not speak; the exhibitions in our own England are quite sufficient to illustrate the point in hand.

'Strong men' and 'strong women' are among the attractions at country fairs; and when a second Hercules or Samson is really keeping within the limits of his exceptional muscular development, no great harm is done. If a man *can* twist an iron bar into a knot, or hang half a ton weight round his neck without hurting himself, and if he can earn a living more easily in this way than by ordinary work, we will not criticise him too closely. But it is a depraved taste that encourages women to such displays. To bear two weights of fifty or sixty pounds each suspended from the hair, is unfeminine enough; it is much worse to see a woman lying down, shoulders on one chair, feet and ankles on another, an anvil placed on her body, and two men wielding heavy hammers on the anvil! William Hutton's strong woman, Phoebe Bown, who could lift a hundredweight with each hand, carry fourteen stone, or walk forty miles a day, was not an exhibitor; she honestly earned her living at the mannish employments of driving a team, guiding the plough, thatching ricks, and breaking-in horses; disliking the womanish avocations of sewing, knitting, spinning, and cooking.

Legitimate exercises carried to excess lie beyond the range of feats which we have here in view. The training of boys and youths in a gymnasium ground is an excellent thing, strengthening the muscles and expanding the chest; but to stand on your head on the top of a pole is neither useful nor ornamental. Pulling an oar on a pleasant stream is beautiful and invigorating exercise; but it may be doubted whether emulation does not carry the Oxonians and Cantabs too far in the violent struggle of the annual boat-race on the Thames; constitutions have been permanently injured by this. Swimming is so capital a thing, so useful for everybody to learn, that we welcome any encouragement given to it

by striking displays in our rivers and channels; yet here again there is a loophole for strivings much better avoided. Captain Webb has done what no one ever did before, and wisely resolves to rest content without straining for further glorification; but he has had imitators who narrowly escaped drowning while attempting that which they could not accomplish; and he has unintentionally been the means of tempting a new class of exhibitors—girls or young women who, clad in pink fleshings, make a public display of swimming ten or twelve miles down the Thames, nearly hemmed in by steam-boats laden with sight-seeing visitors, mostly of the opposite sex. Even well-to-do folks who climb mountains are a little too prone to the sensational in connection with emulation. To go halfway up the Matterhorn is as useful as to reach the summit; but then the glory—and the danger!

TIGER TALES.

It was guest-night at our regimental mess in A—, and conversation ranged over a vast variety of topics. After dinner a few officers, myself for one, left the table and adjourned for a chat to the smoking-room. I chanced to sit near an elderly gentleman who had been my opposite neighbour during dinner, and with whom I had already exchanged a few observations. His manner was courteous and agreeable; he was the guest of the regimental surgeon, who had been in India for several years; and I inferred from the conversation of Mr Humfrey—for this was the gentleman's name—that he was a Bengal civilian of long standing, only lately returned from India. He spoke with great approbation of the Prince's pluck and endurance in India, where he and his companions had incurred no inconsiderable risk. Allusion was made by an officer to the incident of a tiger having sprung on the elephant on which the Prince was riding; when His Royal Highness, without apparently the least discomposure at the near vicinity of the savage beast, had taken steady aim from the howdah, and shot the tiger as he clung behind.

'A pretty close shave that must have been for the Prince,' observed a young officer who had been listening.

'In such a case the danger is really less than you might suppose,' replied Mr Humfrey. 'The tiger rarely makes a second spring when his first has failed of its object: he appears to be disappointed and cowed, and if permitted, will generally slink back to the jungle without attempting any further attack. Instances to the contrary are of course known; but this is their usual habit, and I have heard of many marvellous escapes made in consequence of it. Two gentlemen, friends of mine, were travelling together up country some years ago, in a carriage belonging to one of them, drawn by a pair of very good horses, with a native coachman and other servants. A little way from the road was a fine point of view, which one of them had not seen. His companion had been there before, and offered to take him to it. Quitting the carriage, and desiring the servants to remain with it under the trees of a jungle-wood by which they were passing, they walked to the place where the prospect was to be obtained. Having seen all they wished, they returned to the spot where the carriage had been left; but not a trace of it or of

any of the servants was to be found. Wondering what could be the cause of their disappearance, they shouted loudly, and strolled in various directions through the wood to look for any signs of them. Presently they were hailed by some one from the branch of a tree high above their heads; and looking up, they perceived one of the native servants cowering close to the trunk, making gestures expressive of extreme terror.

"What are you doing up there? Come down directly," said his master angrily; and with the slavish obedience of the domestic Hindu, the man slid rapidly down, and with pressed palms stood trembling before the two gentlemen.

"What is the meaning of this? Where is the carriage?"

"When you gone, Sahib, tiger came," replied the man, shivering at the very remembrance of his fright—"tiger came; jumped at horses; all gone away in jungle."

"That they were all gone away was sufficiently evident—very unpleasantly so, when they discovered, by further examination of the servant, that as they were quietly resting under the shade of the trees, the horses suddenly became sidgety and pricked their ears; a slight rustling was heard among some bushes on the opposite side of the road, and in a moment more a large tiger had stolen from among them, paused for an instant, and then made a bound with the intention of alighting on one of the horses. The instinct of self-preservation made the terrified animals dash furiously forward, and the tiger missed his aim and fell harmlessly on the ground. Apparently he was disgusted by his failure, for he tried nothing more; but after one sullen glare at the retreating vehicle, he gave a low angry growl, and turning away from the spot, was soon lost to sight in the long grass of the jungle. One or two of the servants had disappeared with the carriage. This man had run a little way, and then climbed a tree, from which he had not ventured to descend until he heard the voice of his master. Of course, the tiger might still be lurking near, and a fresh attack might not have the same result. So the two gentlemen hailed with satisfaction the return of the runaway carriage and horses, which had been secured after a short run; and all felt extremely thankful that their search for the picturesque had not brought them in contact with an object more striking than agreeable, the black and yellow stripes and gleaming eyes of a hungry Bengal tiger, on the outlook for what it might devour."

"Wonderful escape!" "Extraordinary good luck!" "Shockingly unpleasant position!" we variously exclaimed on the conclusion of Mr Humsfrey's anecdote. "The tiger could not have been in a very voracious frame of mind, however," I continued, "or he might surely have retrieved his first error, and had a meal off somebody. Your friends must have rejoiced to find themselves well out of the jungle, and under the shelter of a comfortable roof."

"No doubt of it," said Mr Humsfrey, smiling; "and yet incidents of that kind soon fade from the memory. I could relate dozens of similar hair-breadth escapes; and most probably my friend Dr Laurensen could do the same. Tigers and snakes are always unpleasant possibilities when one travels in India; eh! Laurensen?"

The worthy surgeon thus appealed to gave a few vigorous whiffs at his cigar, and then removing it from his lips and beginning leisurely to knock off the ashes, he observed: "Well, I daresay I could tell you of one or two surprising experiences in that line.—You, sir," he continued, addressing himself to me, "made the remark that those travellers would be glad to find themselves safe and sound beneath the shelter of a roof. I'll tell you of an occasion when your humble servant felt that gratifying sensation in no ordinary degree; not for myself alone, I am bound to say, but for others also, who were in some measure under my protection."

He saw we were all listening attentively; so, resigning himself to the loss of his cigar, he reflected for a moment, and then continued: "Some years ago, while serving with the 300th in Bengal, I had a pretty smart touch of fever; and when able to move, I was invalided for the time, and went to a place on the hills to get up my strength again. 'The scenery all round was remarkably pretty: high hills, many of them wooded to the very top; romantic crags crowned with brushwood jutting out every here and there; and various light bungalows, as the Indian houses are called, peeping from among the foliage, placed there to serve as residences for those who sought the hill-station to try to re-establish their failing health. It suited me very well, and I soon began to pick up: indeed I felt so well that I was on the point of returning to my duty, when I received a letter from a young fellow, son of an old friend in England, saying that he was on his way to join his regiment with his bride, and if I could take them in for a few days, they would be very glad to give me a call in passing. Hospitality in India is one of the cardinal virtues; less so now, perhaps, than it used to be; but at that station we were all very hospitable, and besides, I was only too happy to welcome the son of my old friend. In due time Captain and Mrs Hastings arrived; he a fine manly young soldier; she the prettiest little creature, of nineteen or twenty, that any man could wish to call his wife: fair hair, lovely blue eyes, and a complexion of lilies and roses, most refreshing to eyes long accustomed to the pale cheeks of Indian beauties."

"This lady sang sweetly to the guitar; and looked perfectly bewitching as she sat in the veranda with a blue ribbon round her neck, playing on the instrument which she had brought up with her. She was a very good artist too, and sketched cleverly from nature. She had a book of English sketches with her, so I was able to judge of her capabilities; and when she said she should like to take some views of the scenery near my bungalow, I felt only too happy to assist her in doing so, and never dreamt of warning her against any danger more serious than sunstroke. To avoid this she went out on her sketching expeditions either in the early morning before the heat had become troublesome, or in the cool hours of the evening, more generally the latter; her husband always accompanying her, and usually myself too. I certainly knew that in such a locality as this tigers were not an impossibility; but I had never given them a thought. No one had spoken of them as being in the neighbourhood; and one generally hears when such unpleasant gentry are about. Not very far from my bungalow there was a very

pretty water-fall, surrounded by picturesque rocks and greenery; just the sort of place to delight an artist; and I accordingly proposed to Mrs Hastings that she should make a sketch of it. She was charmed by the suggestion; and we three set off one lovely evening, as soon as the temperature permitted of our climbing the rather steep winding path that led to the spot. It was a narrow, roughly formed track, and we walked singly, I leading the way, and Captain and Mrs Hastings behind. Sometimes she paused for a few moments and drew her husband's attention to some wild-flower or similar object, and I had got a little in advance, and came to a point in the road where it turned sharply round some rocks, not a great way from the cascade, the murmur of whose water I could now hear distinctly. Here I halted to recover breath, and to let them come up with me; when suddenly, in the perfect stillness of the evening, I heard a slight rustling and crackling among the bushes just beyond the rocks; and glancing round to ascertain the cause, I saw what made every nerve in my body quiver violently, and seemed to bring my very heart into my mouth, as the saying is.

'At this juncture a huge Bengal tiger, one of the largest I had ever seen, emerged from among the shrubs not forty paces from me, and with a swinging deliberate movement began to cross an open space bordering the path that led towards the water-fall. I neither moved nor spoke, but gazed with stupefied horror at the savage beast, unable for the moment to decide on any plan of action. The tiger immediately perceived me and stopped; for one or two seconds only, though they seemed an age to me, I do assure you, we stared fixedly at each other, when, to my unutterable relief, he lazily half-closed his fierce yellow eyes once or twice, gave a slight wave to his tail. I think I see him now!—and without taking any further notice of me, went slowly off in the direction of the water-fall. Doubtless, the creature was on his way thither to slake his thirst, an object which was probably for the time of paramount importance with him. He had also probably lately dined, to which fact might chiefly be attributed his indifference to food so very close at hand as myself. As he disappeared from sight my assurance returned to me; and knowing that he was only a little way off, and might think better of it at any moment, and spring upon us unexpectedly, I felt most anxious to get my young friends and myself out of his immediate neighbourhood with the least possible delay. They had now reached the spot where I stood; and while Mrs Hastings stopped again and began to fan herself, for the evening was very sultry, I affected to shew her husband something on the rock beside me, and whispered to him hurriedly: "For any sake, get her home! Make some excuse; but get her back as quickly as you can!"

'He glanced at me—saw by the expression of my face that something was wrong—and turning at once to his wife, who was unconsciously fanning herself with her eyes closed, he said hastily: "Eva, my darling, I am not well; I should like to go back at once. Come quickly."

'She opened her blue eyes very wide, and looked first at him, then at me. My face must have betrayed me, for she said very quietly: "What is

it! Fred is not ill. You have seen something. I am quite ready; let us go at once."

'Courageous little woman! Not another word did she utter; but with white face and set lips she walked firmly and rapidly down the path we had just mounted. Her husband kept close to her; I followed them a few steps behind, my ears strained to the utmost for any rustle that should betray the neighbourhood of the tiger; and more than once my heart gave a bound as one of us stepped on a rotten twig and it cracked noisily across, or a stone touched by the foot rolled down in front of us and loosened a little of the dry soil. We walked fast and in perfect silence; but the way home seemed twice the length it had done when we came: minutes feel like hours in such circumstances. We saw nothing more of the tiger, and reached home safely. When I saw the lovely brave girl and her young husband again under my roof, and realised the frightful danger to which they had been exposed, I must say I was indeed truly thankful for their escape and my own. Mrs Hastings was rather pale and nervous for the remainder of the evening, and willingly acceded to my request that there might be no more sketching expeditions while they were with me. The wisdom of this resolve became more manifest, and our miraculous preservation all the more striking, in a day or two. A poor woman and her child were killed by the monster the very next day, and a native postman a day or two later; and it was evident that the tiger was a new-comer, and a very undesirable acquisition to the neighbourhood. A party of sportsmen was formed, therefore, as speedily as possible, Captain Hastings remaining longer than he intended in order to join it; and after several hours of close tracking and beating, the tiger took refuge in a clump of bushes, from which he was speedily dislodged, and stretched on the ground with a bullet through his head. He was an enormous brute, measuring fully nine feet from his snout to the tip of his tail. Being very beautifully marked, his skin was taken off and presented to Mrs Hastings by the man who shot him, as a souvenir of her dangerous evening walk.'

Some further conversation and one or two other anecdotes followed. It was now getting late, and some of the guests glanced at their watches. 'Before we finish this discussion, I must tell you a tiger story myself,' said Colonel Darley, the commanding officer of the 188th. 'It is rather different from those we have heard, but I daresay it will amuse some of the youngsters. A good many years ago I served in the same regiment with a young fellow of the name of Waldron. He was a pleasant sort of fellow in his way, but rather inclined to be extravagant; and he was a little eccentric and queer; had "a bee in his bonnet," as our friends across the Border would say. He was continually picking up odd pets of various kinds, more like a school-boy than a full-grown man; and we were always laughing at him about his collection of birds and animals, owls, white mice, squirrels, a fox, monkeys, and so on. But he took it all very good-naturedly, and went on adding to his menagerie, as we termed it, whenever he came across any specimen that hit his fancy. One morning our colonel was writing in his business-room, when a knock came to the door, and on his desiring whoever it was to enter, Mr Waldron walked in.

"I beg your pardon, sir; I am perhaps interrupting you."

"Not at all, not at all," replied the colonel. "Did you wish to speak to me about anything?"

"Well, sir," said Mr Waldron, in a slightly hesitating manner, "I have just come across a nice little tiger; but I thought before bringing him here I ought to see whether you have any objections to my keeping one."

"Objections! Mr Waldron; not I," replied the colonel, who, as it happened, had just been writing about a butler or man-servant for his sister, and never doubted that the "tiger" his subaltern spoke of was a small boy for going errands or some such occupation. "I have no right to interfere with matters of this kind. Unless, of course," he added, suddenly remembering that the young officer was said to be rather extravagant; "I conclude you are quite able to afford the expense?"

"Oh! certainly, sir," said Mr Waldron, smiling; "that will be a mere trifle, nothing to mention."

"Well, I should suppose so," said the colonel.

"Very good, sir: you don't mind it at all. That's all right. I only thought I'd better ask you. Good-morning, sir."

"Good-morning," replied the colonel; and as the door closed behind his officer, the colonel resumed his pen, half thinking to himself as he did so: "Odd young fellow that; I wonder why he fancied I might not like his tiger." But he understood Mr Waldron's scruples, and admitted their propriety most unhesitatingly, a few hours afterwards.

Evening came, and with it the mess-hour. We were all assembled, and about half-way through dinner, when suddenly a terrific uproar arose outside in the barrack-yard. Wild cries and shouts, the screams of women and children, and the noise of horses madly tearing about the yard, caused us all to rush from the table to find out the cause of the unusual disturbance. We found everything in confusion—all the horses loose, galloping about in frantic terror; and as several people spoke at once and very excitedly, it was not easy at first to ascertain what had happened. The colonel's voice restored comparative order. "What is it? What is the meaning of this?" he sternly demanded.

"It's the tiger, sir! the tiger!"

"The tiger!" repeated the colonel in amazement. "What tiger?"

"Mr Waldron's tiger, sir; it's just come. We put it in beside the horses, in a spare stall; and it frightened them, sir, very badly, and they all broke loose."

"A tiger among the horses!" reiterated the colonel. "What can the fellow mean!" Then observing the figure of Mr Waldron disappearing in the direction of the stables, a light seemed to dawn upon him, and he stamped his foot with vigour, and gave vent to his feelings in some rather strong expressions, which I shall not repeat here. In another moment he was roaring with laughter, in which we all joined, though with but a partial comprehension of the cause of his merriment. However, it was all quickly explained. Mr Waldron had been fascinated by the attractions of a young tiger-cub, and strongly wished to become its possessor; but feeling it to be rather a peculiar pet, he thought he had better obtain permission to keep it before entering on the purchase.

"He never dreamt of mystifying the colonel, and I

had no idea his object was misunderstood. The cub duly arrived—a well-grown young animal, and for the time being, was consigned to a spare stall, to the unrestrainable terror of the horses, who smelt the tiger and became excited, and when he began to growl, dashed violently about, burst their fastenings, and got out into the yard, where they made the commotion that had disturbed us. The tiger was speedily removed, order again restored, and Mr Waldron was requested to confine his acquisitions for the future to less alarming kinds of animals. For many a day, however, "Waldron's tiger" was a standing joke in the regiment, the colonel enjoying the story as much as any one. "No more tigers here, my dear fellows; we'll take lions instead—when in action."

We all laughed heartily at Colonel Darley's anecdote, and declared it was capital.

"And a positive fact," said the colonel. "It really happened."

THE MONTH:

SCIENCE AND ARTS.

THE Institution of Civil Engineers have during many years published reports of their meetings and discussions under the title *Minutes of Proceedings*. Bound in compact octavo volumes, these *Proceedings* are distributed among the members of the Institution, who thereby are kept informed of the principal undertakings and incidents in civil engineering, and of improvements gained by experience. At the beginning of last year the Council of the Institution made a change which has increased the value of the publication, for, in addition to the minutes of proceedings, they give 'selected papers' on important subjects, and 'abstracts of papers in foreign transactions and periodicals,' and thus make their members acquainted with what is going on in all parts of the world. These abstracts range over the whole theory, practice, and science of civil engineering, as may be inferred from the fact that there are one hundred and twenty-three in the last two volumes. Is any one desirous to know something about the St Gothard tunnel—the diminution of water in springs and rivers—remedies against landslips—distribution of velocities in a current—the pollution of the Seine—protection of inflammable materials against fire—relation between galvanic resistance and motion of conductor—application of the tuning-fork in electric telegraphy, or about many other subjects?—he will find them set forth in the work above mentioned, which is published at the house of the Institution, 25 Great George Street, Westminster.

Inventors who through want of occupation consider themselves neglected, should read the list of *Subjects for Papers*, comprising ninety-six subjects, published by the Institution of Mechanical Engineers early in the present year. Machinery and mechanism of every kind appear to be therein mentioned, and to afford scope for every kind of faculty. We quote a few examples: Steam-engines, boilers, pumping-engines, blast-engines, locomotive engines, steam road rollers, hot-air engines, water-wheels, wind-mills, sugar-mills, oil-mills; lace, knitting, and rope-making machinery; saw-mills, wood-working and stone-working machines, hammers, locks, lifts, pressure-gauges, sluices, wall-sinking, dredging, blowing-fans, signals, telegraphs.

From this selection the great variety of subjects in the original list may be judged of. Anything wise and new on any one of them could hardly fail to be well considered if addressed to the Secretary at Birmingham.

The question is often asked: How are young men who cannot obtain entrance to a factory as apprentices, to learn a mechanical trade? An answer has been given in the Russian department of the Centennial Exhibition at Philadelphia by display of models and other appliances from the Imperial Technical Schools of St Petersburg and Moscow. In the words of an American contemporary, these collections 'demonstrate the feasibility of so educating pupils, that when they pass out from the doors of their school, they will have become at once scholars in their learning from books, and proficient as educated workmen in the varied branches of the workshop. These young men on leaving college are quite as able to demand work as journeymen as the average of mechanics when out of their time, for they will have performed by unaided effort such feats in workmanship as none but skilled workmen can do. The demonstration of the Russian school is that this practical instruction can be given in the fullest range and quality, not only without interfering with, but positively to the advancement of other indispensable professional studies.'

The *Science Papers*, chiefly *Pharmacological and Botanical*, of the late Daniel Hanbury, have been collected and published with illustrations in a handsome volume. There is also a Memoir of the author, which sets him forth in his true light as one of the ablest and most amiable of botanists and pharmacologists. His industry was only equalled by his knowledge, and both were of the highest order, and his death at the comparatively early age of forty-nine was alike a loss to society and to science. The author of the Memoir closes it with a few words which under present circumstances are worth consideration: 'Those who think that easy circumstances and leisure are favourable to intellectual effort are tremendously mistaken.'

Artillerists and military engineers have something to talk about in the eighty-one-ton gun which has been transported from Woolwich to Shoeburyness, where it throws its ponderous shot to a distance of five miles, and could double that distance if required, and with less noise than is made by guns not half the size. When four such guns are mounted in the turrets of the huge ironclad destined to receive them, she will be a formidable vessel either for attack or defence; able to batter an enemy's fortress from a distance of three miles. But already this monster gun has a rival, for guns weighing a hundred tons each have been constructed at Elswick on the Tyne for the Italian government; and as they have been shipped to Italy, we shall soon hear of their achievements.

An allied topic is the blowing up of the dangerous reef of rocks which has for ages encumbered the channel between New York and Long Island, and with so much furious tidal commotion, that the first settlers named it Hell Gate. The mass of rock to be removed to make a clear channel twenty-six feet deep was about seventy thousand cubic yards. Miners have been at work upon it for seven years: fifty thousand pounds of dynamite were packed in the borings and excavations; and on Sunday, September 24, the whole was fired.

Beyond a slight tremor and a gush of water and smoke, nothing was seen or heard. Some of our readers may perhaps remember that Hell Gate and its neighbourhood was the scene of one of Washington Irving's early stories.

A certain mechanical philosopher has argued that the world would be happier if there were no friction. But how is friction to be abolished? We all know that preparations of grease and oil are used to ease the running of machinery; and from time to time other substances for the same purpose have been talked about. The latest (or newest) of these, an American invention, is called *Metaline*. It is composed of various pulverised ingredients formed into solid plugs by hydraulic pressure. These plugs are fitted into holes on the inside of axle-boxes and the bearing-pieces called 'bushes' by machinists; their effect is such that neither oil nor grease is required, and the wear of the rubbing surfaces is much less than in machinery constructed in the usual way. Whether metaline is applicable to marine engines, to locomotives, railway cars, and all rubbing surfaces of metal, remains to be proved; but we are informed that it has been introduced with advantage into factories in the United States and in Scotland. If wear of metal and the cost of oil and grease can be saved by the use of metaline, the advantage will not be trifling. Readers interested in the question may apply for further information to J. Wallace & Co., Dundee.

From a Report recently published by the Meteorological Office, we learn that one of the difficulties—and a serious one—in weather telegraphy is the frequency of errors in the telegraphic despatches. These despatches contain numerous figures, and hence are perhaps more liable to error than a despatch of words. There are twenty-nine weather stations connected with the Office in the British Islands, and their total number of errors in a year is about two thousand. Of storm-signal stations round the coasts, including the Channel Islands and the Isle of Man, there are one hundred and thirty. When all the lines are in good working order, the Head Office (116 Victoria Street, Westminster) receives fifty-one Reports every morning and nine every afternoon, except on Sundays, from stations which range from one end of Europe to the other—from Christiansund in Norway to Corunna in Spain. Most of the telegrams arrive in London about nine A.M., when the Intelligence Department of the Post Office extracts from them the portions required for its wind and weather Reports. By eleven A.M. the functionaries of the Meteorological Office have reduced and discussed the details for the Daily Weather Report, copies of which are at once supplied to the evening papers. A brief telegraphic summary is despatched to the Ministry of Marine in Paris, and if necessary, intelligence of storms or of atmospherical disturbance is sent to our own coasts and to foreign countries. Later in the day, the afternoon Reports come in, and the Daily Weather Charts having been printed, are distributed by post. Besides all this, a telegram of the weather at fourteen of the principal stations is sent every day to the Underwriters' Rooms at Liverpool, and all the information forwarded to our coasts is also communicated to Lloyd's at the Royal Exchange, where it is posted up for the use of the members.

From the beginning of the present year *The*

Times has published a daily chart of the weather. In order to provide the latest information, the Meteorological Office is kept open till nine p.m., and the particulars then received are embodied in the special chart which appears in *The Times* the next morning. The extra expense (about five hundred pounds a year) which this arrangement involves is defrayed by the owners of the enterprising newspaper. It may be interesting to add that copies of *The Times*, despatched at an early hour each morning from London, are now received in Edinburgh between three and four o'clock in the afternoon, and are spread broadcast over the more northern towns in the course of the evening - thanks to the 'Flying Scotchman.'

The meeting of the British Association at Glasgow brought out statements and communications some of which are so important as to demand notice, however brief, in a chronicle of science. Professor Young's address to the Geological Section placed questions, much debated of late years, on a footing which may be taken as a new point of departure in future discussions concerning the age and constitution of the earth. 'So far,' said the Professor, 'as our present knowledge goes, we must accept it as certain that there is some limit to the duration of the earth in the past. Neither philosophers nor astronomers are agreed on the essential points of the problem; nor have they considered all the possible changes in the position of the earth's axis, and in the rate at which the earth loses heat. Neither have geologists so accurate a knowledge of geological processes that they can speak with confidence either of the absolute or relative rates at which rock formation has advanced. The geologist has hitherto asked for more time, not because he himself was aware of his need, but from a generous regard for the difficulties in which his zoological brother found himself when he attempted to explain the diversity of the animal series as the result of slowly operating causes. The geologist asked for more time simply because he could form no just estimate of what was needed for the physical processes with whose results he was familiar. But palæontological domination is now at an end; and the increasing number of geologists who are also competent physicists and mathematicians appears to mark a new school, which will strive to interpret more precisely the accumulated facts.'

Sir William Thomson's address to the Mathematical and Physical Section dealt with questions that seem unapproachable, but which will occupy the minds of physicists for many a year to come. What is really the geological age of the earth?—Is the earth an absolutely rigid mass, or has it a certain amount of flexibility? The effect of rigidity on the earth's rotation would differ from that of flexibility. For some years astronomers have been aware of 'variations in the earth's rotational periods,' and these variations are supposed to have been produced by the friction of the tides. The amount of friction would vary according as the earth were rigid or flexible. Investigations of the question from the date of the first recorded eclipse, 721 B.C., lead to the conclusion that the earth, as a timekeeper, is going eleven and a half seconds slower per annum now than then. And taking recent observations, 'it seems,' says Sir William, 'that the earth was going slow from 1850 to 1862, so much as to have got behind by seven seconds in

these twelve years, and to have begun going faster again, so as to gain eight seconds in the period 1862—1872.' This irregularity implies a change of sea-level occasioned by elevation or subsidence; and the same eminent authority assures us that 'a settlement of fourteen centimetres in the equatorial regions with corresponding rise of twenty-eight centimetres at the poles would suffice;' and that this change 'would be absolutely undiscussable by astronomical observatories.' These may be regarded as transcendental questions; but some day they will be found susceptible of practical application in science and the arts.

Sir William Thomson having visited the Philadelphia Exhibition as one of the British Commissioners, had something to say about science in America; the deep-sea soundings; the coast survey; the hydrographical researches which, as he confidently expects, will supply the data from tidal observations, by which the amount of the earth's elastic yielding to the distorting influence of the sun and moon will be measured; 'and the fresh marine survey of terrestrial magnetism by the Compass Department, which, as is anticipated, will supply the navigator with data for correcting his compass without sights of sun or stars.'

'In the United States telegraphic department,' continues Sir William, 'I saw and heard Elisha Gray's splendidly worked out electric telephone actually sounding four messages simultaneously on the Morse code, and clearly capable of doing yet four times as many with very moderate improvements of detail. And I saw Edison's automatic telegraph delivering a thousand and fifteen words in fifty-seven seconds. . . . In the Canadian department I heard "To be or not to be" (and various messages) through an electric telegraph wire. All this my own ears heard. The words were shouted with a clear and loud voice by my colleague-judge, Professor Watson, at the far end of the telegraph wire, holding his mouth close to a stretched membrane, carrying a little piece of soft iron, which was thus made to produce, in the neighbourhood of an electro-magnet in circuit with the line, motions proportional to the sonorous motions of the air.'

It will warm the hearts of readers on both sides of the Atlantic to be told that there prevails in America 'the truest scientific spirit and devotion, the originality, the inventiveness, the patient persevering thoroughness of work, the appreciativeness, and the generous open-mindedness and sympathy, from which the great things of science come.'

NOTICE TO OUR READERS.

In the present monthly part is completed the interesting story by Mr Henry W. Lover, entitled *Following up the Track*. In November will be commenced, and will continue till the end of December, a Tale of powerful interest named *The Arab Wife, a Story of the Polynesian Seas*. And in January we will present to our readers the commencement of an original novel by Mrs E. Newman, entitled

THE LAST OF THE HADDONS.

Besides the foregoing Novelettes and Novel, *Chambers's Journal* will contain the usual amount of Instruction and Entertainment.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

STORY OF THE CLYDE.

WHILE still a very young man, I was taken by a kind-hearted friend to see the Clyde and some of the western parts of Scotland. This was in the summer of 1824, about twelve years after the introduction of steam-navigation. In the course of the journey to Glasgow on the top of a stage-coach—six hours from Edinburgh, now done by rail in an hour and a quarter—we met with a chatty old gentleman who seemed to know a good deal about the west coast. He had a large concern, as we learned, in the ham and round-of-beef line, in the Saltmarket, whence he sallied out in various directions in his business operations. Speaking of that, it is but justice to Glasgow to say that it has always been great in substantial eatables—an attractive kind of spiced beef in particular. It was a lucky circumstance for a youngster to fall in with a personage who was full of amusing details on points interesting to a tourist.

The old gentleman told us he had often occasion to go down the Clyde as far as Rothesay. He spoke with delight of the recent invention of steam-boats. 'Before steamers came into operation,' he said, 'it was a difficult thing to get down the Clyde from Glasgow. The only vessels were small craft with sails, and they depended altogether on the wind. Suppose you had perhaps arranged to sail on a Monday morning at six o'clock, you rose early, took a mouthful of breakfast, and hurried down to the Broomielaw. It was all of no use; the wind was dead against the "gabbard;" and the voyage being put off till next morning, you went home to bed, or to spend the morning wearily. The same thing, possibly, took place day after day for a week, until the wind changed, and you were able to get off. It was just as bad getting back—a perfect torment—a dreadful waste of time. Now that is all over. Wonderful things these steam-boats! They have entirely changed the character of the Clyde. But that you'll soon learn. When do you intend to go down the river? Ay, to-morrow morning. Well, see that you are at the Broomie-

law by eight o'clock—the quay about fifty yards below the bridge.'

This pleasant chatter was preliminary to my first acquaintance with the Clyde. I had never seen Glasgow or its now famous river, and was to enjoy something in the nature of a new world. At the appointed time next morning my companion and I were on the quay of the Broomielaw. The river struck me as being small—not wider than the Tweed, and very little deeper. At the quay there were ranged up a few vessels of limited size, such as sailing-boats and lighters, with two or three small steamers low in the water, apparently adapted for a comparatively shallow stream sadly troubled with sand-banks. The opposite bank was a green, grassy plain, on which some cows were quietly grazing, with a row of houses of genteelish aspect in the distance, to the left. Insignificant as was the steamer, we had an agreeable trip, for it afforded a view of the historical and picturesque castle of Dumbarton, along with glimpses of Highland scenery. We reached Rothesay about two o'clock in the afternoon, and, prolonging the voyage, arrived at Campbeltown pretty late in the evening.

The memory of these particulars of a youthful excursion has been revived on perusing the work of Mr Deas, descriptive of the marvellous progress made in the traffic on the Clyde. Through a most skilful process of improvement pursued with indomitable energy, the river which I had seen about the opening of its maritime career has become a spacious tidal canal, capable of bearing fleets of vessels of magnificent dimensions.

In a national point of view, it is desirable to know how this has been accomplished. Ordinarily, there are two ways of going to work with a view to effect the important improvement of rivers, fisheries, and so on. One consists in making continual demands on government to effect the required object, which in plain English signifies that the cost of the whole affair is to come out of the general revenue of the country; that is to say, everybody is to be taxed to improve a particular locality. A mighty pleasant way of doing things this, but not very honest. The other and more rational plan

consists in the people of a locality making no demands on the public purse, but doing what they want at their own expense, or at the expense of those who are to be specially benefited. This latter method has been followed in reference to the improvement of the Clyde, and we see no reason why it should not be pursued everywhere. On one occasion, while travelling in Ireland, we paid a proper compliment to that noble island, by saying to a native that the country possessed immense capabilities of improvement. 'Yes, sir,' was the reply, 'it would be a fine country if they would do anything for us.' In that remark we have a grotesque illustration of much of the backwardness of Ireland as regards general improvement. The people—at least a good number of them—are waiting to have something done for them, and they wait in vain.

A hundred and fifty years ago, the inhabitants of Glasgow, then only a few thousands in number, resolved on improving the Clyde, and they have gone on working at the idea ever since. It was a shrewd conception. The city had great capabilities of advancement. The neighbourhood abounded in iron and coal. The river opened into a channel communicating with the west coast of England and the Atlantic; and the Atlantic was the highway to America. There lay the elements of wealth, and, no doubt, wealth would be realised in immeasurable abundance if the river could be rendered navigable. Such was the reasoning of these Glasgow people. They hardly yet imagined the possibility of bringing the sea up to their city. They would establish a port near the salt water, and carry on traffic by means of lighters. That was the primary notion, and it did good service in its day. In process of time, as trade and wealth increased, the improving of the river on a grand scale, and making Glasgow itself a port, became a predominant idea in this keen-witted and self-reliant community. In short, the tidal water must be made to flow upward over a space of fifteen to eighteen miles, to the Broomielaw, so as to secure the advantages of harbours and docks with a clear and direct route to the sea.

A bold idea! But it is perfectly obvious that you may bring the sea into the heart of almost any country by sufficiently scooping out the bed of a river, and allowing a free action to the tides. Had this idea been originally entertained, much time, and trouble, and money might have been spared. Things, however, were done gradually, according to the views and opinions of successive engineers. Smeaton, Golborne, Watt, Reunier, Telford, and many others were invited to try their hand on the Clyde, each doing less or more to give depth and capacity to the river. The work was chiefly effected at the instance of a body constituted by act of parliament, and known as the Clyde Trustees. One thing to be got rid of was the overflowing of the river in the case of high tides. The banks being low at Glasgow were apt to be submerged. The water rose in the sewers and

deluged the streets. By a simple and somewhat ingenious expedient which answered for a time, the back-water in the sewers was conquered. In each gully-hole in the streets there was stuck a tall wooden funnel, up which the water harmlessly rose in the case of high tides. Our friend the old gentleman on the top of the coach had some droll reminiscences of the people in the Saltmarket hastening on an emergency to fasten the funnels into the gully-holes. Perhaps some persons still living may remember the hurrying about with the funnels.

Mr Deas presents a narrative of proceedings for deepening, widening, and straightening the river, which in some places was so shallow that it could be forded on foot. Where sand-banks were bare at low water, land-ploughs drawn by horses were employed to break up the banks, so that the current might carry the sand away. Where the sand-banks were under water, they were torn up by harrows attached by tackle to the stern of steam-tugs, the liberated debris being swept away by the current and reflux of the tides. Then began processes of dredging, at first by a chain of iron buckets worked by hand and by horses, but afterwards by steam-power. Sometimes the dredgers encountered rocks and boulders, and these had to be mastered by a recourse to diving-bells and blasting. For a long time the engineers were unaware of a remarkable bed or dyke of whinstone rock at the bottom of the river near Elderslie, about four miles from Glasgow. This formidable bed of rock, which was only discovered by the grounding of a large steamer in 1851, extended nine hundred feet in length by about three hundred feet in breadth. It was blown up by gunpowder, the charges being fired by a galvanic battery. The cost of these blasting operations was upwards of sixteen thousand pounds. Much, we are told, remains to be done; but the northern half of the rocky area has been lowered so as to give a channel of fourteen feet at low-water, the other half having an available depth of eight feet. Ultimately, as is expected, there will be a depth throughout of twenty feet at low-water.

Any one steaming up the Clyde will have occasion to observe groups of dredging-machines quietly lifting masses of matter from the bottom of the river, and depositing the dredgings in what are called hopper barges. It would have been a wise policy for the adjoining proprietors to have secured the dredgings for the improvement of their lands—for there is not a little bad land near the Clyde—but the difficulty of making reasonable arrangements for this purpose led the trustees to abandon the attempt, and to convey the whole dredgings to the sea. This they effect by the hopper barges, which empty their contents into a deep spot in Loch Long, twenty-seven miles from Glasgow. The cost of conveying and depositing the stuff is a little above fivepence per cubic yard. When the dredged material was deposited on the land previous to 1862, the cost was

above tenpence per cubic yard. The incessant pouring of barge-loads of rubbish into the sea is certainly in comparison a cheap and easy rid-dance, but one would think it must be attended with the danger of creating shoals anything but advantageous to general navigation. This strikes us as the weak point in the proceedings. The cost of the sundry operations on the Clyde has from first to last, in virtue of acts of parliament, been borne by levying rates on the tonnage of vessels using the river. The administration throughout has been marked by great prudence. With some insignificant failures, whatever has been done has been done well. The total expenditure of the Clyde Trust from the year 1770 to June 1875 amounted to six million seven hundred and seventy-four thousand pounds.

Let us now take a glance at the revolution which the outlay of this large sum of money has happily effected. The first steamer, called the *Comet*, constructed by Henry Bell, and placed on the Clyde in 1812, drew four feet of water, and was capable of carrying forty passengers. It went down the river to Greenock one day and returned the next. Mr Deas was informed by an old gentleman seventy-seven years of age, that he had made a voyage in the *Comet*. 'He left Greenock at ten in the morning for Glasgow; but in consequence of a ripple of head-wind, it was two in the afternoon before they got to Bowling, ten and a half miles from Greenock, where all the passengers were landed, and had to walk to Glasgow [a distance of ten to eleven miles], owing to the want of water, the tide having ebbed. It was no uncommon occurrence for the passengers, when the little steamer was getting exhausted, to take to turning the fly-wheel to assist her.'

We have spoken of what came under our observation in 1821, when several steamers of moderate size were successfully plying. Since then, through the effects of dredging and the enterprise of the people, the Clyde takes rank as a river of first-rate importance. The river on which Henry Bell's little steamer occasionally stuck carries ocean steamers without obstruction to the harbour of Glasgow. At present the minimum depth of the navigable channel may be stated at fifteen feet at low-water, and about twenty-five feet at high-water. Vessels drawing twenty-three feet three inches have within the last few months come to Glasgow in one tide from Greenock. Ship-building on the Clyde has advanced in a remarkable manner. In 1875 there were built on it three war-vessels, thirteen paddle, and a hundred and thirteen screw steamers. Including other kinds of craft, there were built on it a total of two hundred and seventy-six vessels. For the year ending 30th June 1875, the revenue of the Clyde Trust was £1,196,326. A survey of the shipping at the harbour and docks of Glasgow would communicate a feeling of an enormous trade with all parts of the world.

The truth is, the rise of Glasgow is one of the wonders in the modern history of Great Britain—a greater wonder still when we consider the poor and backward state of Scotland at the Union. From thirty-five thousand in 1771, the population of Glasgow has swollen to half a million, and it has become the second city of the empire, with apparently no limit to its wealth and importance. As a centre of manufacturing industry it has several

advantages, but all would have been unavailing without the Clyde and its marvellous improvements. These reflect immense credit on the far-seeing intelligence of the community, and from the result a moral of no mean significance may be drawn. We are reminded of the value of energetic self-reliance, accompanied with a resolution to overcome the most formidable difficulties. The French, it is said, think of the possibility of bringing the sea up to Paris—a heavy undertaking, when we take into account the length of way to be excavated, and other circumstances. Rome appears to have had some thoughts of scooping out the Tiber and becoming a sea-port—a thing easily accomplished in comparison to the dredging of the Clyde. On the Tyne great things have lately been done in the way of deepening and improving the channel. There may be other enterprises of this nature in contemplation, for which Glasgow offers an example worthy of being followed. But the works on the Clyde are not half over. In the interests of public health and sensibilities, the purification of the river from sewage remains as a great work to be faced and overcome. It is a herculean task; but looking at what has been already achieved, we entertain no doubt that by united action, and an adjustment of the rights of all parties concerned, everything will come right at last. w. c.

THE ARAB WIFE.

A TALE OF THE POLYNESIAN SEAS.

CHAPTER I. THE AMERICAN SKIPPER.

My father was colonel of an English regiment of dragoons; and at the early age of seventeen I was gazetted as cornet under his command. We were stationed at the cavalry cantonments of Kirkee, some few miles from the famous city of Poona, and I had just escaped from the nuisances of drill and riding-school, which I was forced to undergo, although, as a son of the regiment, I had long been familiar with everything which a subaltern is supposed to know. Having plenty of spare time on my hands, I occupied myself diligently in learning the dialect of the common people, who here speak Gujarati, the language of the Parsees and of the western sea-port towns of India. While time was thus passing agreeably and profitably, I was one morning surprised by my father, who came into the bungalow in a state of sorrowful excitement. 'Charlie,' he said, 'your Uncle Joe in Australia has gone under, and has left us every farthing he possessed. Poor Joe! I haven't seen him for twenty years, when he left Southampton for the New World. He was very sanguine about making a fortune and buying back our old estates in England.'

I had never seen this uncle; and as he was a very bad correspondent, his letters had been few and far between. We were stationed at the Cape when my mother died, and a letter arrived from him in answer to the announcement; since which time we had heard nothing about him. My father seemed to feel the death of his brother keenly; but I hardly knew how to offer him any consolation, nor did I like to ask whether my uncle's death would make any change in our mode of life. I therefore remained silent until he chose to inform me, which he did in the evening after the mess-dinner. There had been one or

two remarks made on the subject *sotto voce* among our brother-officers, and I could not help thinking that there was an unwonted hilarity in the manner of the lieutenant-colonel and one or two others. The secret of this was explained by my father, who took me aside in the mess-room and told me, to my great astonishment, that my Uncle Joe had died worth a quarter of a million, and that we should leave the service immediately.

In a few days accordingly, our papers were made out, and we took the horse-dak for Panwell, where we found a schooner going to Calcutta with salt. We engaged our passage; and soon arrived at the mouth of the Hoogly, where we found a pilot-boat; and as my father was very fidgety about loss of time, and annoyed over the slow run from Panwell, we engaged it for the trip up to Calcutta. When we arrived at the City of Palaces we had more waiting before we could find a vessel bound for Melbourne. But at length the colonel was introduced to the skipper of the *Shooting Star*, Captain Robert Orde, an American gentleman, who owned his vessel, and sailed wherever he could see an opportunity of profit.

'Colonel Wade,' said he (my father was very proud of his name, which he derived from the famous General Wade), 'if you like to come along with me, I guess you can; but I must do the Christian thing by you, and tell you the truth—I'm dreadfully short-handed. What with sickness and what with desertion, I'm thirteen men short.'

'Lascars make good sailors, I'm told, Captain Orde,' said my father; 'hire them, and fill up your complement.'

'You're about right, colonel, as to their making good sailors, so far as mere sailing is concerned, and so long as they're in a warm climate; but they make mighty mean fighters.'

'Well, captain, do you expect to go to war with anybody?'

'No, sir; I don't like it: it don't pay. But I haven't the choice this time, nor has any man who sails the Chinese seas.'

'Take us, Orde,' said my father, clapping him on the shoulder, 'and you'll have two fellows that will fight. I've been soldiering for thirty years, and Charlie is a rare fighter, according to his own account.'

While I was endeavouring to disclaim this compliment, preliminaries were adjusted by the entrance of the clerk with the papers. The colonel paid the passage-money; and a handsome double cabin on board the *Shooting Star* was assigned to our use. We took possession, and next day the vessel left Calcutta, bearing us towards our fortunes in Australia.

Life at sea is so dreary and uniform that I may be pardoned for saying little about it. The Yankee skipper was evidently very much to my father's taste, for he was never tired of conversing with him and listening to his yarns. I liked the latter well enough myself; but their long discussions about republics and monarchies and their arguments about slavery I found excessively dry, so I struck up an acquaintance with the second-mate, who taught me how to make knots, how to steer, and how to take an observation. All this time the wind blew steadily from the north-east, and the ship's log shewed such cheering figures that my father's impatience was assuaged, and his spirits were uniformly high. But the wind veered round

to the north, then to the north-west, then west, and at last blew south-west with tremendous force, increasing in violence so greatly that we were obliged to reduce our sails to a double-reefed fore-top-sail and storm-jib. It became quite a storm; and as the captain seemed somewhat anxious, the colonel asked him downright if we were going to have a typhoon. Captain Orde in his pleasant way slipped both his arms into ours, and walking us up and down the quarter-deck, said: 'Gents both, I don't care how hard it blows, or how long it blows, for the *Shooting Star* knows how to behave herself agin wind and wave; but my experience is that when these gales blow themselves out, we may generally expect a calm, and a long calm too. And if you will remember the little talk we had at Calcutta, you may remember what I said about being under-manned. Now the fastest vessel that ever sailed is no better than a fish out of water in a calm, and I'm free to say that in case of a brush I wish I had more men. However, it's agin my natur, as we Yanks say, to make trouble; but your shap eye, colonel, saw the puckers in my brow; you wanted to know the reason, and you do.'

'That's hearty, captain. I declare you ought to have been born in our little island, you're so downright. Of course you're all the better for telling us, and so are we; and when the time comes we'll shew you what British sabres can do.'

'Colonel, I hope never to see it; but when the time comes, I'll shew you a weapon a trifle more valuable than a sabre, a little thing like this;' and he pulled out a pistol all gilding and ivory. 'There,' said he; 'this is what we call a revolver, and this pretty toy will kill seven men in seven seconds. I've another, colonel, which you're welcome to; and if there's any slaying around these parts, you'll admit that this little weapon is the right thing in the right place. When the calm comes, as come it will, I'll shew you how to use it.'

Captain Orde was right in his prediction, for in less than twenty-four hours the wind died completely away, and we were rocking on the troubled waters. Soon they too became absolutely at rest, save for the long swell, that seemed like the breathing of some huge animal, which made our vessel rock as if she would pitch the masts clean out of her. Even this at last ceased, and we were absolutely and completely becalmed. Then began our initiation into the mysteries of the seven-shooting pistol. The colonel and I practised daily at bottles in the water, and became quite expert; and then my governor insisted that his man Duncan should learn too. Captain Orde seemed to be full of humour and overbrimming spirits, as if the realisation of his predictions had made him in better temper with himself and every one around him. His vessel was a temperance one, not that no liquors were kept on board, but that the men had no daily allowance of grog. But on special occasions the grog-tub made its appearance at eight bells, and each man had his tot. Apparently this calm weather, when the men had nothing to do save to make ratlin and plait seunit, was one of them, and the crew declared with a good-natured oath that 'Bully Orde was a skipper as *was* a skipper, and knowed the feelings of a sailor.' There were altogether thirty-three American seamen on board, and fifteen

Lascars, and the latter seemed as fine men as I had ever seen. But Orde looked at them contemptuously, and though he interfered when the first-mate, who was rather rough, struck one of them for some offence, yet it was plain that he would have given the whole fifteen for four white men.

Under pretence of finding work for the men, the muskets were overhauled, cleaned, and ranged in glittering rows round the masts; the lumber about the decks was stowed away, so as to give a fair show to the two twelve-pound carronades that formed the ship's armament; the cutlasses were ground to razor sharpness, though the captain told my father confidentially that they didn't amount to a row of pins, and the vessel was made as fit for combat as if an enemy were in actual sight. Some of the seamen laughed about the skipper's devices to keep the men from idleness; but the older men said nothing, and yet looked out towards the south-east, as if expecting to see something. The three mates and the quarter-masters took turn about to be on the look-out in an incidental and careless way; and so the calm continued for a fortnight and nothing had happened. The vigorous manner in which some of us whistled for a wind would certainly have brought a hurricane, according to old superstitions; but we had not even that luck, and day by day she lay

Like a painted ship
Upon a painted ocean.

My father took it upon him to rally the captain upon the failure of his predictions.

'Colonel,' said the wise American, 'I only predicted a calm; and calm you will acknowledge it to be. I feared the proas of the piratical Malays; but I didn't predict 'em. I fear them still, and shall continue to, until we're going easy on a bowline for Port Philip Heads. We seem, you see, Charlie, as if we were still; but we're moving steady, steady towards the Strait of Malacca. The current sweeps us steadily in that direction, and has been taking us nearer and nearer to our enemy ever since the calm set in. A breeze might spring up and give us a chance to spread our wings from this piratical, head-cutting, stink-pot-dropping neighbourhood, before the yellow-skinned wretches and the black blubber-tipped nigger Papuans smell out the whereabouts of so much decent flesh and blood. It might do so, gentlemen; if this were a story in a novel, the breeze might spring just as we were having a warm bout with the swartly sinners; but you mark my words: we shan't have any such luck.—And colonel, it's what I call an uncommon privilege to have the pleasure of pouring my previsions into your sympathising ears, for I have continually to make-pretence afore the men, and the reaction is great. It's a privilege, sir, and I esteem it as such. Try a cheroot; they're real Trichinopoly.'

We accepted the offer, and were just engaged in the act of all three bending our heads to the same match, when the second-mate approached our group hurriedly and said in low excited tones: 'Captain, there's a whole fleet of proas coming up from the south.'

Captain Orde very leisurely lighted his cheroot, while I must confess I dropped mine, and my father forgot to light his. He gave a few puffs and said: 'Who saw them?'

'I myself, captain.'

'Telescope?'

'Yes, sir.'

'Far off?'

'Very far.'

'That will do, sir; I am obliged to you for your vigilance.'

As the officer withdrew he looked quizzically after him and said: 'Flynn is a good fellow; but he's a desperate slow-witted man. I'll wager three drinks, colonel, that there's five or six sampans half-way between us and them proas, and he's never seen them.'

'What's a sampan, skipper?' I asked.

'Why, Charlie, it's a canoe about as substantial as an egg-shell and about as large. The proas always send fellows out to reconnoitre; skirmishers, you military men would call them, only they don't skirmish.'

'Could you not order out your boats, and let my son and me take command of them, and capture or kill these skirmishers?'

'Heem!' said the skipper; 'we'll find them first; we'll examine the ocean, and try if my prediction, as you term it, is anywhere near the mark.'

I dived down into the cabin hurriedly and brought up a pair of opera-glasses, through which I took a hurried squint, but without seeing anything save the glassy water. Joining my father and Captain Orde, I found the latter armed with a tremendous telescope of his own construction, for which he was going to take a patent when he returned to the States. He was looking steadily in the direction of the east, and then swept his glass around a half-circle for about fifteen minutes. We were in an agony of impatience when he put it down, and waited for him to speak; but he handed the telescope to my father without a word.

'One, two, three; by Jove, there are seven little boats,' cried my father. 'Captain Orde, I believe you're descended from the Salem witches.'

'No, sir; I'm from Newhaven. Not but what Salem's a pretty place, but Newhaven's a better; and as for witches, let Charlie go sleighing there winter-time, and I guess there'll be some bewitching.'

'How long will it be before those scoundrels come up to us?'

'About a day and a half.'

'Are they in much force?'

'Look for yourself, colonel. The proas are nigh hull down, and it's hard to count heads at that distance; but there are seven proas.'

'Then each proa sent a sampan as a scout.'

'Jesse, colonel; and there the scout'll remain until the proas come up. And now I'm open to wager that we won't have a wind, and that we'll beat them off; and I'll tell you what I mean to do. Those Lascars can't fight worth a cent. I don't blame them a bit, for it ain't their nature; but it won't do to give them muskets which they can't use to advantage. These proas, sir, are furnished with stink-pots, which they chuck on a Christian's deck, and smother all hands into insensibility. Now, I propose to do this. The Lascars shall be armed with long bamboos and stationed in the rigging. You and Charlie and some others and myself, who can shoot pretty decently, will just keep track of the stink-pot men and crack away at them. The Lascars with their long poles must shatter the stink-pots in the enemy's hands; and between

us we must never let one come on our decks, for if we do, our decent heads will be hung up in some charming village of Borneo. How do you like that, colonel?

'Like which, Orle: the head business or your plan of operations?'

'Why, my plan, of course.'

'I like it very well. But I must tell you that I understand artillery tolerably well, and if you will permit me, I'll take one of your carronades.'

'Just as you please, my good friend; though, if you have no objection, I should prefer your services at the rigging; but of course I should be proud to have you anywhere. One of our men has been in Uncle Sam's navy, and the second-mate is an old hand as a gunner; however, your decision will be mine.'

My father elected for the twelve-pounder, which I was sorry for, as I should have liked to fight beside him. But Captain Orle took me on one side, and assured me that the rigging was the place of honour, as the natives always fired their brass swivels at it; and the stink-pots were really the most formidable artillery we had to encounter. So the revolver which he had given to my father was intrusted to me; and very proud I was of the confidence and the opportunity of shewing my pluck. We took our meals as usual, though for my part I was too excited to eat; but my father insisted that I should eat heartily, and I did my best. On him and the skipper the excitement produced no perceptible change; and the first-mate, who, by special invitation, shared the last dinner, ate as if endeavouring to do justice to the situation.

The proas had now come fully into sight, and were indeed only a mile or two off. The bulwarks of our vessel were uncommonly high, and the hammocks of the men were triced up in man-of-war fashion. The carronades were heavily loaded, and the muskets were capped and ready lying on the deck. It was for me rather a doleful dinner; and I am free to acknowledge that when my father took me on one side and solemnly kissed me, I could not help some large tears from silently stealing down my cheek.

'Charlie, my boy,' said my father, 'we are in the hands of Providence, and can never know what may happen. I have luckily sent all the money I had to England, and have therefore nothing but clothing to lose. But I have something here which I could not dispose of in India, and which I could not send by any one.' Here he drew from underneath his shirt a small bag, which I had always supposed contained some relic or pledge of affection. He opened the mouth, and poured into his hand an enormous diamond of the most perfect water, a sapphire rather bigger, and two huge pearls.

'There,' said he; 'if Brother Joe had not died, that would have been the best part of your fortune. It's my loot at Ahmednuggur. I give them to you now, and advise you to secrete them, for you are so young and so boyish-looking that you will be made a slave; whereas, if the ship is taken, we grizzled beards will lose the number of our mess. God bless and keep my dear boy!' Here he kissed me on the forehead, passed his hands caressingly over my curly yellow hair, and gently pushed me out of the cabin. I secreted the precious gems in an inner pocket of my vest,

resolved to put them in my mouth if I should find myself a captive.

As it was approaching sunset, which is very speedy in those countries, the boatswain's whistle blew, and we hurried on deck. My dear old father came out stripped to the waist, and I thought, as he took his place beside the carronade on the starboard side, that he looked more than ever a perfect gentleman. The crew seemed to think so too, for they gave him a ringing cheer, to which he bowed his grand old head; and Captain Orle, who was beside me, whispered: 'Charlie, your father's one of that breed called trumps, and if you grow up like him, you'll be a good fellow to know.' The boatswain piped again, and the captain came out into the centre of the deck to make a little speech.

He said: 'My men, I'm short-handed, as you know, and not through any fault or meanness of mine.' (Chorus, 'That's so.') 'I thank you for saying so, because, if I thought, or if others thought, that I had jeopardised the lives of Christian men and my own ship to save a few dollars, I should be ashamed of the hour I was born.' ('Good boy! bully for you!') 'I intend to fight this ship as long as there's a man to defend it, or there's a plank to defend. When there ain't, them Yellow Jacks can take what's left.' ('Hooray!') 'We've two passengers aboard, men, whom you can see. They're gentlemen, and they're likely to do a mighty deal of fighting. And men, we'll have to be pretty sly, or these British will do more fight than we, which, as Americans, we can't permit now.' ('Hooray!' and considerable laughter.) 'And now, I've said all I've to say, and in about ten minutes the ball will open. These heathens are going to pay us a visit. My words are: "Let's make it lively for them."'

This speech was received very heartily by the men, who were evidently prepared to do their utmost; and my father still further encouraged them by engaging to give every man who came out of the fight a hundred dollars in silver, and to pay the same to his widow if he got killed.

A great shout from the proas arrested our attention, and we turned towards the sea. We could distinctly see the flashing of their oars as they moved simultaneously towards our left, evidently intending to take up a position around our bows. They were at this time about half a mile distant; and though the second-mate wished to give them a shot, the captain decided that it was useless, as we had no round-shot, nothing but slugs and canister. We therefore watched them in silence as they moved through the motionless water, each minute shewing more clearly the grinning teeth of the wretches inside. We could distinguish the various races among them—the hairless, chinless, blubber-lipped, woolly-headed Papuans; the sleek, yellow, tiger-like Malays; and the bronzed bold forms of the Arabs. The sun was low in the heavens, about an hour from sunset, as they gradually drew near; and all seemed so peaceful, so still, so beautiful, that my mind involuntarily softened, and I wished that it were possible to avoid a fight for which previously I had been eagerly longing. But the noise of the carronades that were being dragged forward awoke me from my reverie. I turned round, and saw Captain Orle at my elbow.

'I rather think, Charlie, that these niggers will be somewhat surprised. They've come up on our bows because they've seen only two portholes, both aft; but if you look opposite to where them carronades are posted, you'll see ten portholes, that I didn't think necessary to indicate by unnecessary painting. There's a compartment of the bulwarks that slides aside, and when the darkies come up we'll give them *Hail Columbia!* Business will commence pretty speedily. You and I will take the foremast with eight Lascars and their bamboo poles; the second-mate and a quarter-master will take the main; and two trusty fellows will have the mizzen.'

'All very satisfactory, captain,' said I; 'but won't the second-mate get the post of honour? Isn't the mainmast the most ticklish part?'

'No, sirree; I wouldn't go back on a friend in that way. We, my boy, have got to stand the brunt of the first attack; and it's only as the prows forge ahead in the thick of the battle that their muskets will speak. That's why we're here with the revolvers. Beautiful weather for slaying, isn't it?'

I looked surprised, when he burst out: 'Don't mind my feeble joke; but it's an expression among the Western men when they're scalp-hunting. These fellows that we're going to tackle go for the whole head, being more civilised. But here they come! Shake hands, chum, and then aim steady and fire slow.'

We shook hands formally, and ascended the rigging of the foremast, taking our position half way up to the foretop, the Lascars clustering below us with their long poles, and others mounting to the top itself. I looked anxiously at my father, and saw him steady as a rock, with his hand on the lanyard and his eye immovably fixed on the prows.

THE GEOGRAPHICAL DISTRIBUTION OF ANIMALS.

EVERY one whose life has not been wholly spent within city walls must have observed that animal life varies greatly in the districts with which he is familiar. Different species are not found uniformly scattered over the surface of the country, but in different localities with similar features. Every country boy knows 'Postlethwaite Oaks' is the only place for miles round where he has a chance of capturing a Purple Emperor butterfly, or that if he visits 'Harkend Brook' at the proper season the chances are that he finds two or three kingfishers' nests. If we quit our own confined districts and travel into other counties or countries, new kinds of animals appear; and the more extensive the range of our observation the greater the difference in the forms of animated life. If we should be sufficiently curious or interested to ask ourselves 'Why should this be so?' we should probably feel satisfied with the obvious, though somewhat vague answer, that 'differences of climate and vegetation demand animal life in harmony.' In all likelihood we should not go a step farther back and ask ourselves: 'Have these peculiar species existed in these peculiar localities throughout all time?' A modern naturalist, however, could easily shew the insufficiency of this answer. He would point out that various regions of the world, closely resembling each other in both

climate and vegetation, are nevertheless inhabited by very different kinds of animals. Thus the forests of Equatorial Africa teem with elephants, apes, leopards, guinea-fowls, and touracos; while the similar arboreal regions of South America shew the tapir, the prehensile-tailed monkey, the jaguar, the curassow, and the toucan. Certain parts of Australia are remarkably like certain parts of Africa; but while the latter possess the mighty lion, the graceful zebra, and the tall giraffe, the former can produce nothing larger or more formidable than the kangaroo, the wombat, or the phalanger. Many large and important groups of animals are found restricted in their range in some way that cannot be accounted for merely by climate or soil. Antelopes are found only in Africa and Asia; sloths only in South America; true lemurs are limited to Madagascar; birds-of-paradise to New Guinea. Acknowledging the cogency of this objection to our explanation of the facts, and now at the end of our resources, we should require to look beyond ourselves and our own range of knowledge for an answer.

Responsive to our look of inquiry up starts Mr Alfred Russel Wallace, of *Malay Archipelago* fame, and gives us, in two large and handsome volumes, a most learned and fascinating account of the distribution of animals throughout the world.* The reader need not fear that this work is too scientifically dry for any but the professed naturalist. The last part, it is true, consisting of a systematic sketch of the chief families of land-animals in their geographical relations, may well be left to the professional; but there is abundance of interesting reading in the other three sections of the book. Part first, in particular, treating of the general phenomena of distribution, we recommend every one to peruse. Here we can do little more than indicate the theory of zoological distribution as set forth by Mr Wallace, with a very few callings from his interesting examples and details.

Those who have studied the subject scientifically have one factor to use in their answer to the question with which we started, not at the disposal of the ordinary observer. They deal with the problem of distribution not only with reference to the present, but with all the light that can be shed upon it from the past. Historical geology gives most valuable aid in determining the probable explanation of the distribution of living creatures. By attention to the various geological strata we can reproduce the physical geography of the earth in the remotest times. Quoting from Geikie's *Manual of Historical Geology*, issued by the publishers of this *Journal*, we find that 'vast changes in the relative position of land and sea there have been; myriads of species of plants and animals have successively appeared, and then vanished for ever; the same climatic conditions have not always persisted in the same latitude, but ever and anon warm conditions of temperature have given place to cold, and *vice versa*.' In particular, paleontology or the science of fossil animals, a branch of historical geology, is most useful, by giving the clearest indications of the former states of distribution.

With due regard to materials both past and

* *The Geographical Distribution of Animals*. By Alfred Russel Wallace, author of *The Malay Archipelago*, &c. London: Macmillan & Co. 1876.

present, Mr Wallace's answer to the question whether the same species have existed in the same localities throughout all time, is, in the mass, as follows. All the higher forms at least of animal life appear to have had their origin in one and the same region of the globe, and have thence migrated to the other regions, which seem all at one time or another to have been in connection with the original seat of animal life. Different obstacles have determined the migration of one species in one direction and another in another, and the various upheavals and depressions of land-surfaces which have taken place, account to a great extent for the phenomena of zoological distribution. The migrated animals having reached other countries, became gradually modified to suit their new conditions of life, and so fresh varieties were introduced. The greatest dissimilarity to the fauna of the original region will be found in those parts of the world from which it has been separated during the longest period.

To shew that there would be no difficulty in whole continents being thus stocked by immigration, Mr Wallace reminds us of the wonderful power of multiplication among animals. A bird which produces ten pair of young during its life and lives for five years, will increase to one hundred million in forty years. Many fishes and insects are capable of multiplying many thousand-fold each year, so that in a few years they would number billions and trillions. Even large animals which produce only one at a birth may, in less than forty years, increase from a single pair to ten million. These calculations are of course on the supposition of abundant sustenance and absence of enemies.

Some animals seem able to range over whole continents, stopped by almost no physical obstacle. The elephant, for instance, can climb steep mountains, cross deep rivers, and force its way through dense jungle. There would appear, therefore, no limit to its power of migrating overland from any one spot save the necessity of food and a suitable climate. Other groups of animals are much more limited. Apes, lemurs, and many monkeys are strictly adapted to an arboreal life. The camel, giraffe, and zebra, on the other hand, cannot exist in a forest country. We thus begin to see how the animals would migrate from their original region in different directions. A wide desert on one side would favour the emigration of camels and zebras and stop that of monkeys. A tract of marshy ground would prove an effectual barrier to animals adapted to a dry and hilly region; and so on. An arm of the sea would be an insuperable obstacle to most animals, yet many beasts can swim great distances, and are known to have extended their range in this manner. The jaguar, bear, bison, and even the pig, are good swimmers. Sir Charles Lyell tells us of some pigs only six months old that, during the floods in Scotland in 1820, were carried out to sea, swam five miles, and got on shore again. Ice-floes and driftwood would, besides, assist migration over expanses of water. Spix and Martius, for instance, declare that they frequently saw monkeys, tiger-cats, and squirrels carried down the Amazon on pieces of floating vegetation.

It seems at first sight a strange fact that many birds are as strictly limited by barriers as the mammalia. Only birds of very powerful wing

can cross any great width of sea, and even these seldom do so unless compelled by the exigencies of food and climate. Flocks of birds are sometimes swept out to sea by violent storms, and though often destroyed, are sometimes carried to lands hundreds of miles distant. Birds whose habits keep them sheltered by forests are not exposed to such a fate, and therefore are confined more strictly in their own districts. The annual migration of many birds to a more genial climate 'may be looked upon,' says Mr Wallace, 'as an exaggeration of a habit, common to all locomotive animals, of moving about in search of food.' In the tropics, birds move northward with the summer, feeding on young flower-buds, larvae, and ripening fruits; while the birds in Polar regions are driven southward in winter by hunger, cold, and darkness. Migrations such as that of the nightingale in April, from Africa and Asia northward, probably date from the period when there was continuous land along the route passed over. Geologists can tell us that in comparatively recent times Britain was connected with the continent, and Gibraltar, Sicily, and Malta with Africa. 'The submersion of these two tracts of land (which were perhaps of considerable extent) would be a slow process, and from year to year the change might be hardly perceptible. It is easy to see how the migration that had once taken place over continuous land would be kept up, first over lagoons and marshes, then over a narrow channel, and subsequently over a considerable sea, no one generation of birds ever perceiving any difference in the route.' The sea-passage is, however, dangerous to many birds. Great numbers of quails when migrating are drowned in unfavourable weather, and probably the migration would cease were the sea to become a little wider. Many birds, on the contrary, from the introduction of favourable conditions by man and other causes, have greatly increased their area of migration.

Causes proceeding from animals themselves, affect zoological distribution. A herd of goats introduced into St Helena destroyed a whole flora of forest trees, and with them the insects, the mollusca, and perhaps birds dependent on them. Swine exterminated the dodo in Mauritius. Neither horses nor cattle run wild in Paraguay, (though they are abundant both to the north and south of it), on account of a fly which destroys the new-born young of these animals. Pigeons are thin where monkeys abound. The relation of one form of life to another is well illustrated by Mr Darwin's case of the cats and clover (*Origin of Species*, 6th ed. p. 57). Red clover is fertilised in this country by humble-bees only. Field-mice keep down humble-bees by destroying their combs and nests. Field-mice in their turn are kept down by cats and owls; and so upon these carnivorous animals depends the existence of red clover!

The naturalist, in confronting the question of animal distribution, soon feels his need of 'some system of geographical arrangement which shall serve the double purpose of affording a convenient subdivision of his subject, and at the same time of giving expression to the main results at which he has arrived.' Hence the discussion about 'zoological regions.' For a number of reasons, Mr Wallace thinks that the earth is naturally divided into six great regions, marked

by certain differences of animal life. Of course these regions, which correspond pretty closely to the great geographical divisions of the globe, are not separated from each other by hard-and-fast lines, but by zones of neutral territory, in which some of the species characteristic of each region are intermingled. They were chosen mainly with regard to the mammals, but are found to suit other forms of animal life. Of these six regions an excellent map is given at the beginning of the work, and each has also a separate map to itself. His first region he calls the *Palaearctic* region (that is, northern region of the Old World). It consists of Europe, Asia with the exception of India and the Indo-Chinese peninsula, and Africa north of the Tropic of Cancer. The second or *Ethiopian* region embraces the rest of Africa, Madagascar, and the Mascarene Islands. The third or *Oriental* region is of comparatively small extent, consisting of India, the Indo-Chinese peninsula, and the western Malay Islands. The *Australian* region comprises Australia, New Zealand, the tropical islands of the Pacific, and the Malay Archipelago from Celebes on the west to the Solomon Islands on the east. The *Neotropical* region (tropics of the New World) consists of South America and Central America to the Tropic of Cancer. The sixth and last district, the *Neartic* (northern region of the New World), is North America and Greenland. Mr Wallace finds the original dwelling-place of the higher forms of animal organism in the Palaearctic region. It is to Europe and Asia that he bids us look as the starting-point from which animal migration has been carried on throughout the ages. From geological investigations we find that the present fauna of Europe is almost wholly new. 'For a long succession of ages, various forms of monkeys, hyenas, lions, horses, hipparions, tapirs, rhinoceroses, hippopotami, elephants, mastodons, deer, and antelopes, together with almost all the forms now living, produced a rich and varied fauna such as we now see only in the open country of tropical Africa.' There is no ground for believing that the climate was more favourable to these animals then than now, so that they were true indigenes, whose banishment or extinction is a strange phenomenon, most probably due to the combined action of the glacial period and the subsidence of large tracts of land once connecting Europe with Africa. It is at least interesting to observe here a coincidence which Mr Wallace himself has probably not noticed. In this work we find that an apostle of development and natural selection has come to a conclusion respecting the original seat of animal life in perfect harmony with the Mosaic account of the creation of living creatures in the Asiatic garden of Eden.

Mr Wallace thinks it almost beyond a doubt that each of the other great regions into which he has partitioned the globe was at one time in connection with the Palaearctic. For the main stream of migration must have gone overland. Only minor features of distribution are accounted for by the help given by floating vegetation, icebergs, &c. A comparison of the fossils of the Old and New Worlds points to the conclusion that most at least of the different higher kinds of animals inhabited Europe and Asia *before* they inhabited America. Australia, whose connection with the Palaearctic region must have been in the remotest ages, should on this theory be found to have the most

special fauna. So eminently in this case do facts support the theory, that it has been proposed to divide the globe into two zoological regions, of which Australia and the adjacent islands should form one! The line of emigration from Europe to Africa was probably always a dry and desert track, suitable to antelopes and felines, but almost impassable by animals adapted to a fertile and well-wooded country. Now the absence of bears and deer from the fauna of tropical Africa has always been a puzzle; but when it is remembered that neither of these animals could make way over a desert region, and if we accept Mr Wallace's theory, the problem is solved. There are districts in tropical Africa which are apparently well suited for either bears or deer; and if the various species of animals were but newly created where now found, the absence from Africa of the two kinds named above, would be unaccountable. Now it is folly to leave a thing as not to be explained when a reasonable cause can be found, and on the hypothesis given above we have a simple and complete explanation of the zoological distribution of Africa.

The manner in which species have been modified after arriving in a new district is often exceedingly interesting. A remarkable feature among the beetles of Madeira is the unusual number of wingless species, many usually having wings in Europe being without them in Madeira. On the other hand, the species in Madeira which have wings often have them larger than the corresponding species in Europe. These two facts were connected by Mr Darwin, who suggested that flying insects were more apt to be carried out to sea and destroyed than those that do not fly; so that the most frequent fliers would be constantly diminishing, while the more sluggish individuals, who could not or would not fly, would remain to perpetuate the race; and so in time would result the entire loss of wings by insects to whom they were *not a necessity*. Those insects to whom flight *is* a necessity would have to battle with storms, and the strongest winged would survive and in time get stronger, while the weak-winged individuals would become extinct.

The dodo is another highly interesting example of adaptation to new conditions of life. Its remains are found in Madagascar and the Mascarene Islands, which at one time must have been joined to the African continent. While still joined to the mainland the dodo reached that region, and at a period prior to the arrival of the carnivora. When, therefore, the region came to be surrounded by water, the dodo having no enemies, did not require wings, and became the huge unwieldy flightless bird whose picture we are familiar with. And yet it belongs to the family of pigeons! A confirmation of this view is that gigantic land-tortoises, larger than any now living elsewhere on the globe, were developed in the same islands. A striking confirmation of Mr Darwin's theory, that the gay colours of flowers have mostly or perhaps wholly been introduced to attract insects which aid in their fertilisation, is the paucity of insects, and at the same time of brilliant flowers, in New Zealand and the Galapagos Islands. But such curious details are endless.

The principle of distribution used by Mr Wallace should, if sound, apply to the flora as well as to the fauna of the globe. Nor are there

wanting indications that this may be satisfactorily done, and we look forward with some assurance to an affirmative answer to the question: 'Is the distribution of plants mainly dependent on the past depressions and upheavals of the earth's surface?'

In conclusion, it may be interesting to notice a few of the most widely-spread animals, as gathered from the fourth part of Mr Wallace's book. The family of rats is found in nearly every quarter, and bats in every quarter, of the globe. None of the larger land-animals are so widely distributed. Among birds, the most extensively found are swallows, kingfishers, pigeons, falcons, owls, rails, snipes, plovers, herons, ducks, gulls, petrels, pelicans, and grubs. All of these are found in each of Mr Wallace's regions, and also in each of their subdivisions. Crows and swifts are universal except in New Zealand, and cuckoos except in the north of North America. Among reptiles, snakes may be mentioned as nearly cosmopolites, being found everywhere except in New Zealand and the tropical islands of the Pacific; while geckoes or wall-lizards are absent only from the north of North America. Toads are dispersed over the whole world except Madagascar, New Zealand, and the Pacific Islands; and frogs have the same area with the addition of Madagascar.

We have by no means exhausted the interest of Mr Wallace's volumes, but we must stop somewhere, and now refer the reader, with renewed commendations, to the work itself.

THE LAIRD'S RELIEF.

IN TWO PARTS.—PART I.

RANALD McLEAN, the young laird of Brackenhough, was evidently in trouble. As he stood by the window with his fishing-tackle about him, carefully fixing a woodcock wing to a red hackle body, there was a frown upon his brow that betokened an uneasy mind. Outside, the clouds hung heavily, and there was just that warm look in the air and that gentle ripple on the water that meant a heavy creel of fish, if Nature could speak at all; and as he looked down upon the brawling river Bracken that rushed along in the dark-coloured fullness beloved of fishermen, and saw the heavy splash of some old stagers that lay under the alders in his favourite pool, he gave an exclamation of impatience. Turning to the table on which lay the morning letters, and with his eyes glancing from one to the other of two set apart from the rest, he muttered: 'Was ever anything so unfortunate! I'm clean done at last. I must see what Janet's got to say;' and he pulled the bell-rope.

'Tell Mistress Janet I'm wanting her,' he said to the maid-servant who appeared in answer to the call.

Mistress Janet was the housekeeper, a thrifty body, who had lived for forty years at Brackenhough, long before the present laird was born, and without whom latterly it would have been a hard matter to have made both ends meet; for the fortunes of the house had been on the decline for many years, and the encumbered estate which

came to Ranald on the death of his father had not been improved by his having spent a few years in a cavalry regiment, during which he had acquired with much ease a habit of throwing his money about, the result of which was a ruin that seemed gradually approaching completion. Over head and ears in debt, he had retired to the ancient habitation of his family, had cut down the expenses of his establishment right and left, sold his horses, dismissed servants, and hoped by 'living down' and curtailings all his former extravagances and amusements, to bring his affairs into some sort of order. In this he was ably assisted by Janet, to whom the former state of things had been a sore trial; but who now, with a reduced household, consisting of a couple of maids in the house, and a couple of men and a boy in and about the grounds, had a fair opportunity of exercising not only her thrift but her authority, which had fallen sadly into disuse while London servants and London waste raged rampant at Brackenhough.

'Janet, I'm in a fix,' said the laird, as the housekeeper entered the room.

'It'll no be the first time, Maister Ranald,' she replied.

'Look at that;' and he handed her an ominous-looking blue paper. Janet was about to put on her spectacles; but checking herself, said in a resigned tone: 'It's no muckle guid, I'm thinking, to fash my sight wi' it. I ken the shape o' owre weel. It's a writ, likely.'

'Worse, Janet. It's an intimation that some of the Edinburgh people have got tired of waiting, and in order to hasten matters, are going to place a man in possession.'

'What! here at Brackenhough? A beagle in Brackenhough! It canna be sae bad as that, laird!'

'Ay, but it is. But that isn't the only bother. I have another letter here from my aunt Barbara, who is going to pass here on her way to the Highlands with a party of friends, and proposes to pay me a visit of a couple of days.'

'Gude save us, laird! If your friends want anything mair than trout, grouse, and bannocks, wi' aiblins a dish o' mince-collaps—and no a big one neither—they'll need to gang beyont Brackenhough!'

'I know the larder is not in a very flourishing condition.'

'Larder, is it? There's just naethin' in the house, I'm tellin' ye. There's whiles it gars me greet when I gang ben to my ain wee room and see naethin' but empty shelves, whaur ance there wasna room to pit half-a-dizen pots o' preserved rasps, for a' the grand groceries and things that mounted up to the ceilin';' and Janet shook her head sadly at the recollection.

'I know, I know. If they could live on whisky and trout, they'd do first-rate, but—'

'And your aunt Barbara too! wantin' her tea at a' hours, and a' her grand freens the same likely, wi' but twa bit lassies like Phemie and Kirsty to wait too! And your aunt wi' nane nearer kin than yersel to leave a' her siller to, to be peerin' into the nakedness o' the land. She's a canny woman and a carefu', and she'll ken weel it's no fair-play that's brocht Brackenhough to sic a pass.'

'Well, Janet, I think I can manage to put things a little more ship-shape, and give them a welcome

not unworthy of the old house, if you can only undertake to get this man out of the way.'

'And will it be a bit heagle body that the Laird o' Brackenhaugh's afeart o'? Gin there be a hind twixt this and Balgoyle, and water in the Bracken'—

'No, no, Janet,' said McLean, laughing; 'no violence. But search your wits, woman! They mustn't be here together. Get the man out of the way, and I've warrant we has mair than bannocks and whisky for our guests;' and with that he placed his hands in a friendly manner on the old woman's shoulders as he dropped into the vernacular, which he invariably did when he wanted to engage her good graces. He was a very light-hearted young man, a circumstance that had considerably helped his downfall; and he had a wonderful faith in Janet's resources. So, taking up his tackle, he was soon deeply engaged at his favourite sport; and it was not until he had landed a dozen of the spotted beauties that he turned back his thoughts to his difficulties. Now, his aunt Barbara had not acted altogether with thoughtlessness when she talked of visiting him; and a handsome cheque had set his mind at rest upon the subject which had vexed the soul of Janet, namely, the bareness of the larder and the general insufficiency of the *ménage*. But his chief difficulty was owing to a request, that he could only look upon in the light of an order, from his aunt—that she was sure that he would have a proper display of the old family plate, the Alexander flagons, the King Jamie spoons, the Stuart wine-flasks, &c. &c., the great pride and glory of the family. This plate had lain for a long time at the bank at Balgoyle, and was easy enough to obtain; but how was it to be kept with the bailiffs in the house? McLean was on his last legs, knew not where to turn for temporary assistance, and the precious plate would be sold up with everything else; but he had every faith in Janet, and felt pretty sure that if there was a way out of the difficulty she would find it; so he returned to the house, mounted an old cob that was still left to him, and took the road for Balgoyle.

Later on in the day two men stood at the lodge-gate of Brackenhaugh, having just alighted from a tumble-down vehicle which had conveyed them from the coach-road between Balgoyle and Edinburgh. They had travelled over at least ten miles of a wretched road—half morass, half boulders, since they had descended from the stage-coach—through a pitiless driving rain, and were about to proceed upon an errand on which the most sanguine of men might be forgiven for being in doubts as to the warmth of his reception. The elder of the two, Joseph Wilkie, was a sheriff-officer of some standing in Edinburgh, in which town he was a 'residential,' although a Glaswegian by birth and by feeling, from the top of his head to the sole of his foot. Being a man with a Bailie Nicol Jarvie-like hatred of everything wild, uncomfortable, and disorderly, it was strange that he should have voluntarily undertaken his present mission; but he had done so with a view to the advance of his sister's brother-in-law, the youth Gabriel Simpson who accompanied him. This young man, who had not long left London, and was not very favourably impressed by his visit to the North, was about to take up his first 'job' under the auspices of

his relative, and was an unwilling accession to the ranks of the bailiffs; but having been found useless at various other occupations, it was thought that this at least might suit him. The night had fallen as they made their way to the house; but it was not so dark as to enable them to escape the keen look-out of the maid Phemie, who stood at a window with Mistress Janet.

'Mistress Janet!' she exclaimed, 'there's twa o' them.'

'Is't sae, lass? Deil's in't a!' (Janet was no puritan.) She seemed only nonplussed for a moment, however.

'Bin doon, Phemie lass, and tell Kirsty to broach yon muckle keg o' whisky that that thieving Jock Doonaguid gied the Laird last Candlemas. As it's no been through the gaugers' hands, it'll gang well enuch doon the craig o' a beagle, I'm thinkin'.'

Whatever doubts the two officers of the law may have had as to their reception were soon set at rest, as they were cheerfully welcomed by Phemie and her assistant, who, having relieved them of their valises and provided them with lights, preceded them to their rooms.

'Hullo! wha's that?' exclaimed Mr Wilkie, while his companion turned pale, as a terrific yell, accompanied by a pistol-shot and a clashing of steel and smushing of glass, was heard.

'Jest the Laird wi' a few frens,' explained Phemie in answer to their startled looks; 'they're braw lads and fu' o' speerits, but owre fond o' the fechtin'.'

'He doesna ken we're here, does he?' said Mr Wilkie with an anxiety that belied his assumed indifference.

'Gude guide us, na, sirs!' she replied with seeming fright; 'dinna think o't. Jest keep a calm sough, and ye hae naethin' to fear.'

The answer was not reassuring; but after a hurried toilet, much of their discomfort was appeased by the snug appearance of the room to which they were shewn, and the savoury smell of cooked meats that met their expanding nostrils. They were shewn to Mistress Janet's room, where was a well-laid table, on which a newly caught grilse smoked at one end, and a dish of jugged hare at the other, with a brace of grouse to form a reserve; while intervening spaces were variously filled by scones and oatmeal cakes, Gouda cheese, butter, and preserves. These things, together with the civil attentions of the housekeeper and her assistant, had soon a visible effect upon the spirits of the new arrivals. The solids having been despatched, the muckle keg spoken of by Janet was introduced, and under the pleasing influence of King Toddy, disquiet almost disappeared from the breasts of Mr Wilkie and his companion, who rapidly thawed into conversation. The former indeed, who was considered amongst his acquaintances to be something of a lady-killer, and quite noted for his graceful rendering of *I'll hang my Harp on a Willow-tree*, and his powers of entertainment at tea-parties, his graceful carriage, and the amplitude of his shirt-fronts, was more than once aware of the interested gaze of Miss Phemie, which he was not slow to attribute to his personal fascination. When, therefore, she seated herself beside him, and mixing him a stiff tumbler, inquired if he liked it sweet—'Sweet it is,' he replied with fervour, giving her a look of admiration, which

appeared to cover the damsel with confusion; and when he said: 'Will ye no tak a wee drop too, miss?' she assented so shyly, and catching hold of his hand as he laded out a portion into a glass, protested that he was giving her too much, then begged his parlor most demurely, and altogether seemed quite overcome by his attentions. Then she began to ask him about Edinburgh and all the grand doings there. Had he seen the Queen and the Prince; and was he no a fine-looking man? And she kent weel how braw the leddies were dressed; and she had ance been to Edinbro'. And the shops, were they no grand! And he wadna think muckle o' Brackenlaugh? They were just nae mair nor less than wild savages. (At this point his glass was replenished.)

'And are ye mairrit, Mr Wilkie?' To which that gentleman replied briskly in the negative, and moved his chair a little closer.

Meanwhile, Mr Simpson began to talk with Janet, but he did not manage to make himself completely at ease; nor was Janet's conversation altogether calculated to that end. True, she expressed much anxiety for his comfort; but his immunity from harm seemed, according to her, less due to any possible abatement in the ruthlessness of the Laird, than to her own foresight and management. That he was a man of unbridled temper and reckless conduct when under the influence of any excitement, she took pains to convince him of. Each pull at the bell filled Mr Simpson with fear lest at any moment, by some mischance, their presence in the house should be discovered. The whisky seemed to have no soothing effect upon him, and in his agitation he besought Mistress Janet to be sure not to acquaint Mr McLean of his being in the house until he was perfectly calm and composed. To this she willingly assented, and appeared indeed shocked at the thought of acting otherwise.

'But your friend, sir; is he no a wee bit owre-noisy? The Lord kens what'll become o' us a', if he's no carefu'!'

Mr Wilkie's tongue had become loosened under the influence of the repeated jorums supplied to him by the attentive Phemie; his voice had become louder; and forgetful of time, place, and circumstances, he was on the point of bursting into song. Mistress Janet's warning had a visible effect upon Mr Simpson.

'Mr Wilkie,' he said in a hollow voice, 'for 'eaven's sake, shut up. Can't you 'ear what this good lady says, or do you want us all to be murdered?'

'Murdered? Nonsense! Offisher of the law—pershon shaired.—Jes' a wee drap mair, my lass.' And Mr Wilkie raised his glass to his lips, winked knowingly, and gazed round at the company with satisfaction.

'Look 'ere, sir; if you don't shut up, I'll punch yer 'ead. Do you think I'm going to have dirks and things stuck into me?' (Janet had told him a dreadful story about the Laird, in which dirks and blood and gore and strangulation had figured horribly.) 'Or do you think I'm going to get these hamiabie females into trouble 'cos of your beastly intoxication?'

'Tostication yourself. Get out!'

'Yes, sir, I will get out,' said Mr Simpson, in obedience to the entreaties of the two women, who urged that he had better go off to bed at once, and

leave his friend to their management 'if they could prevent evil befalling him;' at which they shook their heads doubtfully. 'And I 'ope you won't be long in following my example.' Seized, however, with anxiety for his friend, as he saw him sitting stupid and helpless in his chair, he went up to him before leaving and said: 'Come, Wilkie, don't be a fool; you'll get into trouble if you don't mind;' and he attempted to raise him from his chair by the arm; but Mr Wilkie, with tipay obstinacy, resisted, and not being able to calculate the exact force he was using, managed both to slip out of his chair on to the floor and to bring the devoted Simpson down on the top of him at the same time. A loud cock-a-doodle-doo of triumph from the inebriated Wilkie accompanied this feat, and the noise struck terror to the soul of Simpson, which was increased by the entrance of Phemie (who had been out of the room a moment), exclaiming: 'Gude guide us and save us, the Laird! the Laird!' And on this the two women hustled the Cockney out of the room into a side-passage, and directing him to his room in a hurried whisper, thrust a light into his hand, and shut the door upon him. He found his room without difficulty, as it chanced to be the first upon the stair which he had been told to ascend; and having carefully locked and bolted the door, he threw himself into a chair, and gave himself up to a contemplation of the position, wiping the perspiration which fell in large drops from his forehead, with a trembling hand.

'Lor, wot an escape! And I ain't hont of it yet; but I don't think those women will peach. Wot *haver* is to become of Wilkie? Shouldn't wonder if they ducked 'im in the 'orse-pond, or played up some dreadful game or another with 'im. These young gents is werry merry, I don't doubt; but they can't do 'im any real harm, I should think. Good 'eavens, no! Ain't we in the nineteenth century, and hain't the pussions of hinstuments of the law sacred? Ah, let's 'ave a look at this window, by the way. None o' yer snuggling in and playin' up games while I'm in bed; and he went to the window, and carefully raising it, looked out. The wind moaned dismally through the trees, now rapidly becoming leafless, for it was well on into the autumn, and the drifting clouds that every now and then obscured the moon brought at intervals a squall of hard-driven rain. He ascertained that the window was sufficiently high from the ground to prevent any one entering, unless by a ladder or some such means; and with a shiver of cold he shut it down again, and slowly prepared for rest, satisfied that he was for the time-being safe. This being so, he could, of course, afford to extend some sympathy to his companion. He listened attentively for any noise that might indicate what was going on; but a stillness seemed to have come over the house since he had left Mistress Janet's room. It might have been that the tramp of footsteps which he had heard, when Phemie uttered her affrighted exclamation, had been directed to some other part of the house, and that the women might have had time to conceal his friend. The party might have broken up and gone away, and if so, they might both be perfectly safe for the night. Fatigued with his day's travelling, and the recent excitement wearing off in the surrounding stillness inside the house, he gradually fell into a sleep, disturbed by

occasional wakings, with a start at first, as recent events assumed various exaggerated forms and sounds, but soon ending in a deep sleep.

How long he had lain like this he was unaware, but he was suddenly awakened by a rattle against the window, which might have been from the rain. He rubbed his eyes and looked about him. The moon still shone upon the blind, and cast the flickering shadows of branches upon it, but—and he started up in his bed with a look of terror upon his face, and then covered his head with the bed-clothes and emitted a terrible groan. But no—it could not be! and yet—As the shadows waved to and fro, the unmistakable shape of a human form swayed also with the movement of the wind. Those stifled groans that he had heard then were not all a dream! It was too horrible! When would this night come to an end? He dared not move. Each creak that the bed gave, as he turned to bury his face deeper in the pillows, was full of horror for him. Each gust of wind went along his nerving nerves like a hot iron. He longed for the light of day, for he dared not look upon the thing that made the night so hideous to him. After waiting in trepidation for a time, which seemed to him endless, the first gray streak of dawn made its appearance—the wind fell, the rain ceased—the horrible shadow had disappeared. Perhaps, after all, it was only his imagination. His night had been disturbed; and what with the late supper, the whisky (an unaccustomed beverage with him, for he had not been long in the North), and the startling events of the evening, it might well be that a distempered fancy alone had been the author of all the misery he had suffered during the last few hours. He cautiously pulled a corner of the blind aside, and his heart gave a sudden leap of joy as the trees appeared unburdened by the weight that he had fully expected to see; but his elation was of short duration, as, casting his eyes lower, he saw a gaunt red-haired man digging a hole at the foot of a tree, while something lay on the ground covered by a cloak. On again looking upward too, he saw that the cut end of a rope dangled from a stont bough, and with a shudder he withdrew from the window. What was to be done? The tips of the boots that protruded from beneath the cloak were, without any manner of doubt, the tips of the boots of Wilkie; and a blue scarf that lay near had assuredly adorned the neck of his friend on the previous evening. He would get away out of the house at any price; he would bribe the man below with all the money in his possession to let him escape. Hurriedly putting on his things, he again went to the window, and raising it gently, beckoned to the man, who stopped digging and the merry air he was humming in an unknown language at the same time; and pulling his forelock, said: ‘How’s ta shentleman after ta nicht’s work?’

‘Ush, for ‘eavens’ sake; don’t speak so loud. I say, what’s that?’

‘Fat’s tat? Ta shentleman kens petter as Tonal. Oh, it was a pounie pit o’ work;’ and the Highlander grinned in great enjoyment at some joke, that was not apparent to the trembling man at the window.

‘What do you mean? What is it, I say?’

‘Oh, she’s jist ta puir pit peagle potty. She’ll no fash ta Laird again, puir man!’

‘Good ‘eavens, it’s a woman then!’

‘Hoots toots! fat for shall she be a wumman? Ta puir peagle potty, I’m telling ye. There was twa, but I dinna ken fads come till tither. Put ta shentleman kens petter as Tonal;’ and the man nodded his head, and looked mysteriously at Mr Simpson, and winked pleasantly.

‘What a cold-blooded ruffian!’ thought that gentleman to himself; ‘but it’s clear he mistakes me for some one else. If so, I may make off and save my money. Poor Wilkie, poor Wilkie! The murdering villains!’ Putting on, therefore, as indifferent an air as he could assume, he inquired of the man if he would assist him out of the window, as he wanted just to take a turn by the river, and did not wish to disturb the house. To this the man willingly assented; and placing his shoulders against the wall, Mr Simpson was enabled to rest his feet upon them, and the man gradually lowering his body to a sitting posture, he jumped off on to *terra firma*. Making Donald a present of a piece of silver—a few moments ago he was ready to turn his pockets inside out for a chance of escape—he asked the nearest way down to the river, which Donald told him.

‘Put wull ta shentleman no pe pack to ta hanging of tither peagle!’

Mr Simpson’s reply was not audible, as with a quickened stride he made for the steps at the end of the terrace, which led to a pathway winding through the plantation down towards the banks of the Bracken. No sooner was he out of sight of the house and of Donald, than he took to his heels, and did not stop till he pulled up breathless about a mile off. Where he was he knew not, nor did he care; it was enough for him that daylight had come, and that he was free and in the open air.

ROUGH SKETCHES FROM THE HEBRIDES.

BY AN ENGLISH LADY.

GLIMPSES OF SKYE.

Who has not heard of the wonderful colouring of the south? And yet, where is colour in all its many and beautiful varieties seen in greater perfection than here among these northern isles? Italy can boast no bluer skies nor seas; and where in Italy can be found such myriad effects of light and shadow, of mist and rainbow, as here? such marvellous cloud-scenery as in these breezy skies, or such vivid blue, and brown, and golden greens as clothe these grass-grown hills! So I thought as we were dreamily gliding past the steep cragged shore and amongst the islands to the curious rock-draperial cave where Flora Macdonald concealed Prince Charlie, and then on again to the creek where we were to land. The reflection thrown from those golden-green, rock-crowned heights into the water below was inexpressibly beautiful, dyeing the water to a mellow, green metallic hue, the apex of each tiny ripple that broke the smoothness of the surface being a vivid splash of pure cobalt. Everywhere the water was so clear and transparent that the bottom was distinctly visible even to a considerable depth. And how beautiful was that ocean flooring! What luxuriant gardens of sea-weeds and sea-flowers; what

forests of tall-stemmed, long-branched, golden-brown plants; what gleaming pavements of pure white sand, patterned with the mosaic of ocean's tread, and casting a moonshiny gleam upwards through the water, which dyed the waves a pale bright emerald. What beds of purple, pink, and grayish rocks and stones, covered with sea-mosses and lichens of vivid green and crimson, and sheltering within the shadow of their crevices hundreds of glowing sea-anemones with their arms wide-spread; and where, floating by, are myriads of transparent medusæ, with their graceful, bell-like forms, delicate pendent ruffles, and long trailing tendrils, all exquisitely hued with violet, rose, and azure. A very ocean paradise! Leaning over the boat's side, I seemed to see in those quiet depths, growing out of the rocks, and sands, and weeds, stately palaces and marble halls, grim fortresses and tranquil gardens; and as the distant cry of the sea-bird mingled with the gentle lapping and murmur of the waves, I seemed to hear innumerable soft voices and strains of dreamy music rising from that mystic under-world. And still we threaded our way onward by the shore and among the islands, many of which had but a local name, to the creek where we were to land in order to ascend the heights as far as the great Storr Rock and its grim Old Man.

The sun was pouring down his rays on our devoted heads, as if to prove that even up here, in the stormy Hebrides, he can shine with southern fervour, and the way was boggy and steep—so steep, indeed, that we were content to stop and rest at full length on the soft dry heather—when we at last reached a point from whence we commanded a full view of the giant Storr, scowling down at us from across another plain and steep ascent. And what a mighty chummed cliff it is! what dizzy precipices, what Titanic granite walls—awful in its gloom, sublime in its grandeur! At its base stands the Old Man of Storr, rising three hundred feet in height, and yet a very pigmy when contrasted with the terrible cliff behind. This rock stands three thousand feet above the sea, and seems a mighty fortress reared by Nature long before the age of man, to endure until the 'everlasting hills' shall fail, and for ever through the ages to keep watch and ward, with its grim lone sentinel, over the mountains and the valleys, the islands and the sea.

Hot and fatiguing as the walk from below was, it was amply repaid by the view from these sunny heights. Stretched out like a living map at our feet, limned and painted by Nature's brush, lay the blue sea, studded with a hundred opaline-hued islets, bounded by misty purple mountains, set in a dazzling sapphire frame. And backward, stretching far away behind us, rose crest beyond crest of golden hill and purple moorland crowned with the awful majesty of the Storr. The wild screaming of sea-birds reached our ears, softened into real beauty; the lazy seal poked his bright-eyed head up gleaming and black from the waves as he

threaded his cool way among the rocks and round the shores; here and there a solan goose dropped like a bolt straight into the water, swallowing its victim before it again emerged, or else with wide dark-tipped snowy wings sped lightly hither and thither; little companies of guillemots sat and floated on the waves, and then diving in an instant disappeared as though by magic; terns, puffins, razor-bills, and white gulls flitted, and skimmed, and dived; and on the shore below us, and up the steep sides of the rocky hills, grazed and scrambled active white-woolled sheep and lambs.

Another day as bright, and warm, and brilliant as the last; an emerald sea, a turquoise sky, a many-tinted gleaming earth; and we are on our mounted way through ten rough miles of mountain gorge, from Sligachan to the foot of one of the mighty Coolin brotherhood, one of the noblest ranges of peaks in Scotland, and whose wonderfully jagged, perpendicular forms impress me more than any mountains I have seen out of Switzerland. Here at the foot of the particular height for whose summit we are bound, we dismount from our plucky, sure-footed little ponies, and pursue our panting way on foot. How I longed for a partial suspension of the law of gravity for those two long hours, during which an inward stubborn resolution set to the tune of 'Never say die,' carried our bodies up to the top of the great bare shoulder, where our consciences at last gave permission to our tired limbs to repose themselves at length on the hard rock and take their rest. And even then we were not quite happy, for force of circumstances constrained us to borrow an idea from Nero, and wish emphatically that the whole race of Midges—not Christians—had but a single neck. But, alas! our wish availed us nothing! Where we rested, round and above us on every side, cold, silent, and grim, towered bare overhanging cliffs and massive walls of stone; graceful peaks and pointed pinnacles seeming the fretted, fluted spires of some mighty old-world cathedral, guarded from the unhallowed touch of man by the bristling points of a mighty array of glittering granite spears. When their lonely fastnesses are invaded they know how to take their vengeance, as the name of the highest peak of the range, the monarch of Skye, bears ominous witness—Scurinaghillian it has been christened; literally, the peak of the young lads—so called in memory of the sad deaths of three youths who attempted the ascent, and who, losing their way in the mist, fell over a precipice and were killed.

Above us shone the unclouded sky, and far below, cradled in this mighty nest of rock, lay the loveliest, bluest lake, all shining and dimpling in the sun. The remembrance of that lonely baby-loch smiling for ever in the midst of such stern barren grandeur, we carried with us through the dusky star-lit gloaming, back along the twenty miles to Portree; and that night, when all the earth was hushed, Fancy spread her wings, and stooping low across the mountains, lifted the little

lake in her arms and flew away with it to dream-land, and laid it gently down in the bright region where my spirit was roaming the happy sleeping hours away.

Before quitting the Highlands, I must say just a few words about the people who live and die in these beautiful regions of mountain and valley, lake and sea. The rain, and the mist, and the sharp mountain air seem favourable for the development of muscle and bone, for these men and women are a fine stalwart healthy race; in many places, especially among the sailor and fisher classes, they are a handsome race as well, with fair hair and skins, fine features, and keen eyes. In and about Stornoway, many of the women are beautiful, and their beauty is set off to great advantage by a very picturesque costume. But everywhere, whether handsome or not, we have found them characterised by a peculiar gentleness and courtesy of manner, by a natural refinement, that removes them utterly from the very slightest tinge of vulgarity and commonness, and by an intelligence and cultivation which are rarely met with among the lower classes in the south. Not only do they nearly all read and write, even those who dwell in miserable mud hovels, but many of them read books, and think, and deliver themselves in well-chosen and intelligible, if quaint English, on various subjects of public and individual, or even political interest, upholding their own opinion warmly and well when they happen to differ from you. Many of them feel and speak strongly on the subject of the system of large landholderships that prevails throughout the Highlands to the exclusion of peasant proprietors, and also of the severity of the game-laws, and the harshness of the punishments attendant on the breaking of those laws. In their speech they are singularly refined; and the very poorest, even when quarrelling, rarely make use of the vulgar, meaningless, and brutal words and oaths that disgrace and disfigure the speech of the poor in England either in town or country. As for real kindness, ready sympathy, and willing help in any emergency, I think these Highlanders cannot easily be surpassed. In an accident, or in cases when a traveller is lost or missing, their voluntary exertions, without any view to remuneration, are as strenuous as though the missing one were a relation of their own; of this we saw a striking instance at Portree.

Original characters too are to be met with here, as elsewhere. One we came across interested us a good deal; and as she was a woman, and noted for attainments not ordinarily met with in a woman, I shall devote a few lines to her. We were on board the gallant ship *Clydesdale*, and bound for Stornoway, when we made her acquaintance. It was then the wool-market throughout Scotland, and our steamer being a commercial boat, went out of its way during two nights and three days to stop at all sorts of little places to take in vast cargoes of wool-packs. I had scarcely imagined before that the whole Highlands could contain the amount of wool we took on board during those days and nights. Early on the third morning we steamed into a lovely little fern-fringed bay called 'Ardvard,' where we were awaited by two boat-loads of people, most of whom to get there had walked miles across the mountains, having expected the *Clydesdale* the evening before, and thus having

been forced to sleep there in the wet and the cold all night. One of these people was the remarkable woman, and our information concerning her was obtained from the captain.

He said she was the best pilot and sailor anywhere on that coast; that she had several times saved boats in dangerous mists and seas; that once in a storm she had piloted our steamer, the *Clydesdale*, safely into harbour; he also said that she was quite the *king* of the district, and had all the men absolutely under her control, and that they paid her not only respect but obedience. She lived by collecting whecks—a boat-load of sacks of which she was then bringing to our steamer to be sent on to London and sold. She was a weather-beaten, clever-looking woman of about eight-and-thirty; she wore a very short scarlet petticoat and black bodice and tunic—at a distance having very much the effect of a kilt—and neat knitted stockings, and boots. It was curious to see her climbing up and down the ship's side and swarming up a rope like a man; and it was more curious still to notice the respect and deference with which the captain, sailors, and men treated her, peasant-woman though she was. As I watched her looking sharp after her interests, and ordering the sailors about in a free-and-easy style, I thought that she had a right to be proud of the position she had won for herself by her talent and energy among those rough honest people. 'Good-bye, Peggy,' called out a gentleman leaning over the side, when the business was all done, and she and her boat were departing. 'Good-bye, sir,' she answered; 'but I'm no Peggy; I'm 'Lisa Mackay!' We watched her till the little boat reached the land, standing upon one of the seats and leaning on an oar that she held upright—in which attitude, with her short scarlet petticoat, she looked strikingly picturesque. Said a gentleman who had taken a rapid sketch of her in his note-book: 'She can't forget she's a woman! She knows she looks well in that red skirt, and in that attitude—all done for effect!' Perhaps it was; but even if it were, I wondered, especially after glancing at the fanciful knickerbocker costumes worn by several of our masculine fellow-passengers, and notably by the speaker, what the fact of her being a woman, and not forgetting it, had to do with it; I confess I could not see.

We discovered during our wanderings that in addition to their other virtues these people add that of hospitality, for if by any chance, fatigue, or bad weather, or loss of way happen to drive you to take shelter in any of their dwellings, let it be the poorest, wretchedest, most savage-looking hut in the Hebrides, or the neatest, trimmest, best-appointed farm-house, in this it is all the same—that is, that in either case you are sure of a kindly and courteous welcome; the best of what they have is ungrudgingly placed at your disposal; and this, I take it, is true hospitality, in the best and oldest meaning of the word. It is equally true that it is impossible to travel far in this part of the world without finding, to your considerable cost, that Scotchmen as a nation know how to look cannily and shrewdly after their own interests, as hotel bills, coach and excursion fares, &c. will abundantly show, it being difficult to see their country without paying highly for the pleasure. But the pleasure is well worth it after all, and so it is a fair bargain; and certainly we have found from

our own experience, that canny and wide-awake as they are, these Highlanders are a fine manly kindly race, and will do not a little for the sake of charity.

ODDS AND ENDS.

INSTANCE OF SCENT IN A DOG.

MANY years ago, when in India, I had a hound of a kind of cross-breed, which in India is known as the Polygal. These dogs are unsuited for coursing, but make splendid companions for long and rapid journeys on horseback, being able to go great distances without fatigue, and caring little for the heat. Phakree (beautiful), for such was her name, had been my companion for years, and during the time was seldom out of my sight. When she had become old, and unable to keep pace with me in my gallops, I parted with her to a friend, whom she seemed to take a great fancy to, and who then resided on the Mahableshwar Hills. My own station, Poonah, lay about eighty miles east of Mahableshwar, and is separated from the hills by three ranges of lofty mountains, which in those days were covered with dense jungle. On the day of my departure, I cautioned my friend to keep Phakree securely chained for some days, so that she might not follow me. On this occasion—for I had been the journey once or twice before—I left the main road, and selected an unfrequented bridle-path for my route, in order that I might enjoy the beautiful mountain scenery through which it led. I had reached Poonah, and had been there for several days, living in my tent, when one night I was roused by the howling of a dog under my bedstead. I struck a light, when, to my astonishment, there was poor Phakree, with a collar round her neck, and a few links of a chain hanging to it. A letter I received next morning from my friend gave me to know that she had broken loose and run away, and that, although he had made every search for her, she was nowhere to be found. He regretted that we should never see her again. She had been four days on her journey; and her famished condition, and the numerous wounds she had on her, shewed the privation she had undergone, and the treatment she had received from the dogs of the different villages through which she had passed. The poor creature had no doubt scented me the whole way, for had she followed or accompanied any one, she would have been cared for and protected. We never parted again.

TURNING SALT WATER INTO FRESH.

All who have read many narratives of shipwrecks must have been struck by the fearful sufferings to which boats' crews are exposed through the want of fresh-water. A boat cannot carry water-tanks of any size, yet she cannot make a voyage without water, and oft-n men have escaped from a sinking vessel only to die a worse death, for want of fresh-water, in an open boat under a tropical sun. This danger can now be avoided by fitting ships' boats with a very simple and compact condensing apparatus which has just been invented and patented by a firm in Dublin. It consists of a small boiler heated by a paraffin lamp. The steam from the boiler, which is filled with salt-water, is condensed in a worm-tube which passes through a receiver filled with cold

sea-water by a pipe passing through the side of the boat; a second pipe allowing the heated water to escape, and so keeping the supply always cool. This apparatus will produce from a pint to a pint and a half of pure water per hour. There is a small tank for collecting and filtering the water, and a second tank contains a supply of oil sufficient to keep the lamp burning ten days. The whole is fitted in the bow of the boat, where it is protected from the wash of the sea by a little 'fore-castle' built over it. Besides removing some of the worst horrors of shipwreck, this invention will be of service in other ways—for instance, to boats navigating and exploring brackish lagoons and arms of the sea, or making short voyages along a coast.

A GOLFER'S ELEGY.*

BENEATH the sod poor Tommy's laid,
Now bunkered fast for good and all;
A better golfer never played
A further or a surer ball.

Among the monarchs of the green
For long he held imperial sway;
And none, the start and end between,
Could match with Tommy in his day!

A triple laurel round his brow,
The light of triumph in his eye,
He stands before us even now
As in the hour of victory.

Thrice belted knight of peerless skill!
Again we see him head the fray;
And memory loves to reckon still
The feats of Tommy in his day.

In vain, to trap his flying sphere,
The greedy sand yawned deep and wide,
Far overhead it circled clear,
Nor dropped but on the safer side.

In vain along the narrow course
Entangling whins in ambush lay,
But never hazard was the source
Of grief to Tommy in his day!

Who could like him with Fortune deal,
And from the fire undaunted snatch,
With steadfast heart and nerve of steel,
The desperate hole that won the match?

To him alike were tee and rut,
From both he found his certain way,
And who could predicate a put
Too long for Tommy in his day?

'For all in all our Tommy take,'
The verdict of the links will say,
'We ne'er shall look on one who'd make
A match for Tommy in his day!'

* Tommy Morris was champion golf-player of the world. Reared at St Andrews, the Scottish headquarters of the national game, he early evinced a talent for golf, doubtless inherited from his father, the much respected custodian of the links; and during the latter years of his career, he, on three successive occasions, carried off 'The Belt' against all comers. He died on Christmas Day 1875, at the early age of twenty-four.

MY SCOUTS.

MUCH of the comfort and indeed, at times, of the success of an Oxford student, depends upon his scout or servant. Like other folks—I may say beyond other folks, they have their peculiarities, the chief of which is a leaning towards perquisites; and this, if not occasionally checked, may seriously tell upon the pockets of their masters. Almost all the scouts I have known were men of the greatest self-importance. In fact of a large class of scouts this may be known to be a distinguishing feature. Most of them lord-mayored it over us to a tremendous extent, and both in manner and person were well fitted for the great civic seat. The reason of this feeling of superiority to their kind is pretty obvious: a Freshman comes up to the University, helpless and in many cases perfectly ignorant of this new world and its ways. His scout therefore becomes for a time his guide, philosopher—I was going to say friend, but perhaps not quite that. His sway is naturally enough never entirely thrown off. It is said that men are never heroes to their valets-de-chambre; how much less heroic would they appear in their valets' eyes if they had known all their boyish scrapes and all the incidents of their childhood! (Tys they call them at Cambridge: a word which signifies in the original Greek a vulture. Our scouts did not deserve quite so bad a title. As their name may signify, they were light-foragers rather than such ravenous harpies as the name in vogue at the sister university would imply.

Before proceeding to individual examples, let me premise once for all that, as a class, they were, and no doubt are, the very best servants in the world. They are quick (a virtue indeed) and invariably obliging. Above all, they never put off doing anything you bid, by saying that they will see about it, or will do it directly. How often does that phrase 'to see about it' bear the bitter fruit of disappointment, when uttered by others than servants! This readiness is the more remarkable, as scouts, having several masters, might make

use of the orders of one as an excuse for omitting to perform those of another. I never heard of such an expedient being used. In my college we were eight on each staircase, and enjoyed the ministrations of two scouts; or, to speak technically, of one scout and one scout's boy. Though called a boy, the latter was generally of mature age, say thirty, and had not infrequently a numerous family of young scouts. But young or old, he always paid the greatest respect to the scout proper. He always addressed him as 'Sir,' and was often severely and loudly reprimanded by him. Like the old Latin poet, I am fond of inquiring into the 'causes of things;' so I fancy that the original scout's boy was in reality his son, at a period when fathers exacted that respectful form of address from their children.

The scout's salary was high: besides fixed wages from the college, he enjoyed no end of perquisites by law or custom, among which was the right to everything which, having primarily emanated from the college kitchen, was left on our Sybaritic tables. He was also liberally tipped at the end of every term by all the men on his staircase. In short, here would be a splendid opportunity of introducing a system of gentlemen-scouts. I am afraid it would not succeed, though; fancy a man's feelings when scout on the very staircase on which he had once inhabited 'drawing-rooms' and dispensed a too free hospitality! Marius a fugitive, Belisarius a beggar, would be nothing to it. The emoluments, nevertheless, would make a man put up with much; and he could still keep up his boating and cricket, since the scouts have athletic clubs, principally supported by their masters. He could have his trip too in the summer, since many scouts take their families to the fashionable watering-places, where they act as extra waiters in the season. Considerably better pay on the whole than most schoolmasters and, sad to say, many clergymen get.

My acquaintance with scout Number One came about in this wise. When I went up to enter on residence, I had never been in Oxford before, having passed my matriculation at school, as was

possible in some cases; so I was set down in a helpless state at the door of St Boniface. I asked for my rooms, and was comforted at finding that some had been assigned to me. That at any rate was a sort of welcome. Off I set, escorted by a one-armed man. You may see him to-day hanging about the gate of a certain college, of which he is one remarkable feature. Men employ him to do little jobs such as going errands; you may often see them tossing him as to whether he is to get a shilling—or not. As you may guess, he always gets it sooner or later; sooner generally, as we used to say at college. For my part I gave him a shilling every term; and all he ever did for it was to sedulously touch his hat whenever I passed through the gates, which might be twenty times a day. With this guide stumping along beside me, I ascended the staircase he indicated, up, up to the very top where Freshmen lie. Then at length I saw a figure, which was destined to become even more familiar to me than that of my guide: a man above the middle height, and decidedly inclined to stoutness; his face somewhat flushed with the good things of this life. His eyes always afterwards appeared to me to express a sort of latent contempt, but at this time they seemed to say: 'Ah, ah! a Freshman; we'll take care of him!' He was clad in a sort of sleeved waistcoat and black trousers; his gold chain was very conspicuous, and so was his black velvet skull-cap, without which I seldom saw him. He was very bald, so whether he used it for warmth or for adornment I can't say; that old staircase was very cold and draughty at the best of times. He was about fifty years old, I should say; and his manners always called up Pecksniff to my mind. He had an oily, insinuating way of his own, and was above all a very incarnation of respectability. 'One-arm' introduced me. The scout made me a very low bow, which was at the same time patronising: 'Mr Brown; yes, sir; these are your rooms, sir; view rather circumscribed, sir; well, it is, sir; but these rooms are always given to Freshmen, sir; I hope I shall make you comfortable.' I was quite abashed by the grandeur of his manner. He never ceased rubbing his hands while speaking; he was always washing them, as the saying is, with invisible soap. From that day I seldom disputed the wishes of Morris. He made me very comfortable, and I am afraid he also made his market of me. Freshmen, as I have observed, have seldom spirit enough to oppose their scout at first, and in this sort of thing the first blow is everything.

What a very respectable man Morris was! I think he was a churchwarden, and this is the reason why. On the day of the Derby, Morris was absent; and in answer to my inquiries, Sam, the scout's boy, informed me—with what I took for a meaning grin—that he was away on business. I of course drew my own conclusions. As I was going down the stairs that evening about nine o'clock, I met Morris coming up. 'What sort of a Derby was it, Morris?' 'Derby, sir?' answered

Morris, as if he had just remembered it. 'Oh, *Blue-gown* won it, sir. I don't know by how much, sir; I've been on vestry business all the afternoon.' Was I mistaken, or did the light of the candle reveal a curious twinkle in his cunning little eyes? Vestry business! I'm not sure whether he was a churchwarden; or it might have been a christening that day. Perhaps he meant *that* by a vestry business. I'm afraid he rather managed me: my glass and china were found exceedingly scanty when I removed to new rooms; but taking everything into consideration, he served me well, and perhaps I broke it myself—we were not very careful. His ideas, however, were rather too luxurious for my purse. I remember his silent scorn when, on having some guests of the fair sex to lunch, I proposed, when discussing the ways and means, to have some claret cup. It was only my second term, and I bent before his glance, and hastily ordered champagne instead. The man who succeeded me in those rooms was a friend of mine, so that I often saw Morris afterwards. His behaviour to me was full of such respectful tact, that he drew an extra tip from me in a moment of weakness. Of course I repented it afterwards; but I was always weak.

I moved into better rooms; but my scout improved even more than my rooms. His name was Mann; and a man he was every inch of him; with quite a high reputation in the college. As I look back on the time I spent on the staircase, I would that a monument might be set up to him, *pour encourager les autres*. May the sod lie lightly on him. Still, he had his little oddities, but they were pleasant ones on the whole. Amusing ones, at least. About six-feet-one in height, florid complexion, black eyes, and black hair and whiskers. He always wore a frock-coat on Sunday. A frank-looking man; one of the hand-omest I ever saw. He always dressed well, but on Sunday quite elegantly.

As far as keeping up your spirits went, Mann was invaluable. When I was 'reading' just before examination week, whenever he entered the room he would remark: 'Keep up *you*.' pluck, sir, and go in as bold as brass! There is nothing like brass; it will carry you over a deal of broken ground, sir. Why, Mr Robinson just over you, sir, he went in last term, and hardly read a word, sir; he got a third. *He* was a cool gentleman, and no mistake.' As in the above, Mann was apt to become rather horsey in his metaphors—I suppose through intercourse with the racing set who inhabited two or three of his rooms. I did get through by a close shave, and have, I don't doubt, been held up as an encouragement to future generations. One virtue, and that a cardinal one at Oxford, Mann possessed in perfection, that of concocting drinks of all kinds; his milled claret, in particular, was perfection. Another quality, also in high esteem there, he possessed, a chronic enmity to duns. Just after I got the rooms, a man came with intent to dun my predecessor. Mann intercepted him, and sent him away with, to use one of

his favourite metaphors, a flea in his ear. I quite shook with delight as I heard the altercation outside my half-open door, and mentally determined on giving Mann an extra half-sovereign when convenient. He would have been a treasure to Mr Mantalini. One of his faults was over-curiosity. He was also rather fond of taking my arm-chair and a novel when I was out. I caught him at it once, and I don't know who was the more confused, scout or master.

Mann looked after my welfare and cared for my interests in a way that no scout did before or after him. I was once very poorly for a week, and he then attended on me in a way which made me really grateful to him. But he *couldn't* make my arrow-root with water, and to every complaint answered, that he had lived with an invalid for ten years and always made it so.

Sorry was I to part with Mann, but I wished to take my degree, and the rooms were in too noisy a situation to allow of much serious reading. So I got a new scout, whose name was Walker. (Py-the-lye, all scouts were addressed by their surnames, all scouts' boys by their Christian names. It had a very peculiar effect, the shouting out such a name as Mann on the staircase as loud as you could; we had no bells.) Alas! I had got, not out of the frying-pan, but out of the brook itself at one leap, into the fire. His appearance was unsatisfactory, a striking contrast to the majestic Mann: he was a short thick man, of sallow complexion, lit up by a flaming scarlet nose of Roman pattern. I don't think his nose belied him. His dress too was generally untidy, and his habits not scrupulously clean. He must have become a scout by mistake, for Nature evidently intended him for a kitchen-boy. Nevertheless some of the qualities of a scout he possessed, and especially an idea that my purse was endless. I needed a coal-scuttle: those used at Oxford are generally very plain; but he provided me with one that much exceeded a guinea in price. I thought it rather dear, since I had given about half-a-crown for the one in my last rooms: but that was a broken one certainly, and purchased from my scout. As a rule, however, Walker had none of the patronising airs of his class. He could not makeiced cup. Think of that! He was the only scout I ever heard of who could not. I was obliged to ask Mann to come over when I wanted any, or else have it from a confectioner; the latter plan being a very dear one. One day the old fellow being away, I asked the reason, and the scout's boy informed me that he had been seized by a sort of fit to which he was subject. Meeting one of my neighbours, I mentioned it. 'Sort of fit!' shouted he, going himself into fits of laughter. 'Subject to it! So he is, by Jove!—They've regularly taken you in. Why, man, he got intoxicated last night, you may bet a pound. He's always doing it; that's his fit.' And he was right, no doubt, for the fits were of frequent recurrence. I did not part with him with feelings of any great regret.

My 'boys' were less amusing than the scouts; they were made more in a mould. My first was named Will. He was tall, dark, and handsome; pulled 'three,' I believe, in the scouts' boat. He had a curious habit of blushing if he made a mistake in waiting at table or knocked a book down. A funny friend of mine used to tell funny stories

on purpose to upset Will's gravity, and generally succeeded. If he did so, Will always had it out in a cupboard, where my plates were kept, plunging in his head like an ostrich, while his coat-tails betrayed his enjoyment. His retreat to this refuge amused us as much as our tales amused him. He also invariably quarrelled with the laundress, and they would carry on an altercation all across the quad. Charles, my next 'boy,' had no peculiarity except his taste in dress and his well-fitting clothes.

Well, those scouts were part of my surroundings during, most likely, the happiest years of my life. They served me—well, they served me well, no matter with what object. No one does anything for nothing. And I parted with my scouts with as much regret as Cooper parted with his Hawk-eye, or that Last of the Mohicans with the unpronounceable name.

During all the time I had to do with them, not one of them ever addressed to me an uncivil word. I always found them ready, if properly requested, to do anything which did not lie quite within the pale of their duties. Mann was especially good in this way; though I have many pleasant recollections also of Morris. Of Walker I can't say much that is good. He was a decidedly shady scout; perhaps he seemed worse after Mann's assiduous attendance. I shall go down some day and see if the last-mentioned is still in the old staircase; we shall have a good deal in common, my old scout and I, more than many people of apparently more congenial positions. When he goes where scouts are scouts no more, may earth lie lightly on his ashes!

THE ARAB WIFE.

A TALE OF THE POLYNESIAN SEAS.

CHAPTER II.—THE FIGHT.

THE piratical craft came on steadily until within musket-shot of our bows. They were all in a huddle, and if we could have veered round the *Shooting Star*, we might have used our cannonades to good purpose. But we were immovable, and could not use the fair opportunity. The proas halted for a few minutes, during which the jabbering on board of their craft was indescribable, and can be likened to nothing save the chattering of a menagerie of apes. At length they seemed resolved upon a line of action, and divided, three proas coming on our port side, three on our starboard, and one holding itself aloof, and rowing behind the three starboard attackers at a leisurely pace. I must confess that I didn't like this division of labour, as I saw clearly that I should have to be separated from Captain Orde. Hardly had I divined this than he said: 'Shimmy up to the top and take the port side. I must remain here.' I went at once; and when I got into the foretop I glanced at the proas, and saw that to starboard the pirates were at least a minute ahead of the scoundrels coming against my station. I examined my muskets—of which there were four in the top ready loaded—and my revolver, exchanged a few words with the Lascars, to encourage them, and then turned round to watch the colonel.

Almost instantly his hand went up, the sliding bulwark went back, his carronade was run forward on the proa that was nearest. It was at that time so near you might have tossed a biscuit among the villains. He pulled the lanyard, and the storm of canister went with a thundering report among the vile crew, killing and wounding many, and playing sul havoc with the frail timbers of the proa. The bulwark slid back, and the reloading commenced, as I supposed, for I turned my head to the contemplation of my own duties, which were sufficiently onerous to claim my entire attention.

When the proas came within range, the same manoeuvre of sliding back the bulwark and firing was repeated by our side with very considerable effect, but not sinking either of the proas. After the discharge of our twelve-pounder, and before we had time to reload, the dusky heathens were swarming up our bulwarks, and standing in the rigging of their short masts, were endeavouring to hoist upon our decks their infamous stink-pots. These were made of earthenware, resembling the chatties of India, and were suspended by ropes of tough coir. I had a feeling, as I poised my musket before aiming at a gigantic Papuan, something as I had experienced before diving in head first when I was learning to swim. I aimed steadily, however, fired, and the man went down. The ice was broken, and from that moment my muskets were fired with as much rapidity and deadly effect as I could compass. Nor did any stink-pot burst over the heads of the men below me, to my great satisfaction. The carronades boomed away with a regularity that was joyful to my ears, easily to be distinguished from the sharp bang of the brass swivels of the pirates. Soon, however, the increasing numbers of the enemy forced us who were in the tops to rally to the assistance of the men in the decks, and, sabre in hand, I dashed into the mêlée. My revolver was emptied, and consequently useless. I soon found myself hotly engaged with a stalwart Arab, who rained down such a shower of blows upon me with his *tulcar* that it was with difficulty I could parry them. I could not even attempt to make any rejoinder, and with the utmost despair I felt my strength fast leaving me. As I endeavoured to collect my strength for a last effort, I was suddenly hooked from behind, and before I could know the cause, I received a blow on the head from the Arab's sword, and lost consciousness.

When I regained it, I found myself lying at the bottom of a proa with the warm blood pouring over my face from a smart cut on the forehead. My hands and feet were bound with some confounded substance that cut into the flesh and gave me extreme pain. But I was so weak from loss of blood that I could not have raised my head if my life had depended on it. I tried in vain for some time to remember where I was or what had transpired, but I could not. The regular loud report of the carronades, the discharge of the muskets, the firing of the swivels, the oaths, the shouts, and all the uproar of determined fight, I heard to perfection, without

the slightest comprehension of what it meant. Vaguely the reports seemed to become less loud, as I again lost consciousness, which was only regained by a swarm of heathens pouring into the proa, and trampling over my prostrate body. Even then I could not realise the misfortune that had befallen me. Soon, however, I heard the regular sound of oars striking the water, and could realise that we were moving. At length this motion stopped, and the firing of the brass swivels began again, and was kept up with considerable spirit. I listened instinctively for the deeper boom of the carronades, not for any particular reason, but because my ear had heard it before at regular intervals, and expected it.

I must have lost consciousness several times, when at last the expected sound was heard. I was gratified I did not know why—but still some instinct seemed to tell me that things were all right, and I fell asleep. My awakening was a rough one. A vessel-full of salt-water was dashed in my face, and the smarting of the wound on my head made me at once very wide awake. I was hauled into an upright position by two oily-skinned Malays, and brought before the Arab who had cut me down. He looked at me and nodded, speaking in what I supposed was Arabic. I answered in Hindustani that I did not speak Arabic. He seemed to recognise some of the sounds, but evidently did not understand what I said. Then I tried Gujarati, which is the sailor-tongue of Western India; but this also was unknown to him. There was, however, another Arab who pressed forward and spoke to me in Cutch, a dialect of Gujarati, and one with which I was fortunately familiar. He then spoke to the man who cut me down, in Arabic; and soon I was deluged with questions as to the vessel that had been attacked, and which I now learned had succeeded in beating them off. I could not help a smile of pleasure at the intelligence, which, however, was soon damped by reflecting on my own situation. The Arabs, of whom there were at least five standing around the one who had felled me, began an animated discussion, which I could not help believing referred to myself, and I waited with considerable anxiety for the result. It was at this time, as near as I could judge by the position of the moon, about midnight. There was a light breeze stirring, very light indeed, but sufficient to fill the sails of the proas, the rowers of which were asleep on their broad benches. The piratical vessels were all together, going very easily, but there was no light of any kind on any of the vessels. I learned afterwards that this is from fear of the sword-fish, which abound in these waters, and which occasionally attack these frail craft, driving their sharp snouts right through the thin planking.

At length the discussion was over, and the Arab chief taking from the silver receptacle in his girdle a broad whistle, applied it to his lips and sent forth a piercing sound. A response came immediately from the six other proas, and within a few seconds light splashes were heard, which were soon accounted for by the appearance of six sampans, which quickly boarded our proa, the chiefs of the other vessels crowding around the Arab. I was somewhat unceremoniously dragged into the centre of the circle and exhibited. The Arab spoke a few brief sentences in Malay, to which the

others responded by motions of assent and waving of hands; whereupon I was as unceremoniously dragged away by the Cutch-speaking Arab, who whispered to me in a low tone of voice when we were at the bow, that I happened to be the only result of the expedition so far; that the Arab chief had taken me prisoner by his sword, and therefore I belonged to him as his slave, which I might consider lucky, for if I had belonged to the general spoil, I should either have been decapitated and my head hung up as a trophy in some Malay hut, or have been given to a Malay chief as a slave, to pass the remainder of my life in cutting wood in the forests, or toiling at the pearl-fisheries.

'*Ihai*,' said I (this being Cutch for brother), 'what does your chief intend to do with me?'

'I do not know,' he replied; 'that will depend very much on yourself.'

'Well, brother, would you cut these bonds around my hands? The coir cuts into the flesh, and I can hardly bear the pain.'

'Wait,' said the friendly Cutchman, 'until the conference of the *reis* is over. They are discussing whether they shall return or seek a fresh prey.'

The pain was really intolerable, and after the smarting of my wounded head had ceased, made itself more and more apparent, and the groans which I could not repress with all my pride, moved my companion to pity. He drew a neat little dagger from his girdle and quickly released me from my agony. Then taking some leaves, he chewed them into a mass and applied it to the places where the skin was cut. Then he examined the cut on my head, which he said was *bahut chota* (a very trifling affair), and that if some slave had not hooked me from behind, the chief's tulwar would inevitably have sent my soul to Eblis. 'Whereas now,' said he with considerableunction, 'the finger of the Prophet, whose name be praised! is on thy head, and thou shalt become a believer of the true God, and a sharer in the paradise of his people.'

To this I made no reply; but I scrutinised the man with more attention than I had hitherto bestowed, being so full of pains and aches from the constrained posture in which I had lain that I had taken very little notice of the persons and things around me. I asked the Cutchman his name. He said he was called Abou Ben Rashid, and that he belonged to the tribe of the Beni Gharras of Morbat. He was clothed in the usual Arab costume, but he had a Hindustani tulwar instead of an Arab sword, which has no crossbar to the hilt; and his girdle was of very massive silver. He was an old man with a scantly grizzled beard, and a face resembling very much what we see in pictures of the Jewish patriarchs. In fact, had I seen it anywhere else I should have taken it for a type of benevolence. Just at that moment too, he was looking specially gentle, for he had a convert in hand, and I had heard my father say that the Mussulmans would move heaven and earth to make proselytes to Mohammedi. I think too, that perhaps the old man felt real compassion for me, for I was singularly blonde in complexion, and if it had not been for the moustache of yellow down which ornamented my upper lip, I might easily have passed for a girl. At any rate it was evident that he wished to be kind, and I felt grateful to him; so I told him that though I had no intention of abandoning the faith in which I was reared, I

had no objection at some future time to hear the tenets which the Arabs held; but that at present I should be grateful if I might have some water to drink. My friend Abou nodded, and brought me some in a calabash, which I drank with the utmost delight. He then unrolled from his arm a coconut matting (which I found afterwards was his prayer carpet) and a light Arab robe, and told me to go to sleep if I could, and not to fear for anything, as the crew understood that I belonged to their chief, whose name was Nizam, though he was generally called Reis or Mirza.

At seventeen, hope is a much more important personage than in later years. Though my position was a painful one, yet the certainty that the *Shooting Star* had escaped, and the strong probability that my dear father was all right, were great consolations. Old Abou was probably high in the confidence of the Reis Nizam, and he was disposed to be friendly. I had not been rifled, and my precious stones were still in the inner pocket of my vest. Something might be done with these. And as I was pondering all sorts of impossible plans I fell fast asleep, and did not wake until the sun was high in the heavens, and old Abou gave me a friendly shake of the arm to waken me.

Though still considerably cramped, I was in good enough spirits when I woke, and felt quite capable of eating anything that might be brought before me. I hinted as much to Abou; but he told me that the Arabs had only two set meals a day, at noon and at sunset; but that if I was very hungry, he would bring me some dates. I assented eagerly, and he brought me a huge lump, nearly a pound, which I ate with so much relish that Abou declared I should make a capital Arab. The wind was very light, and the heavy matting sails hardly drew at all. Soon it came only in catpaws, and the rowers took their stations and commenced their labours. I took the liberty of asking Abou, when he invited me to share the boiled rice and fish which was the noonday meal, whether we were returning to the chief's place or still on the look-out. To my great disgust, I learned that we were still on the look-out.

My first experiences at an Arab meal were peculiar. Neither knife nor fork, and Abou explained that the right hand only must be used, as the left was Sheitan's hand. The manner of proceeding, which I closely imitated, was to take a handful of rice, manipulate it with the fingers into a round ball, and then swallow it, then break off a piece of fish with the fingers, swallow that, and attack the rice again. Let me confess that I did this with keen enjoyment, as a bit of excellent fun. When we had finished eating, Abou called a Papuan and gave him the two platters with a superb air. The nigger received them with a profusion of thanks, and carried them off in high glee; whilst my old friend and I washed our hands as well as we could in the salt-water. Afterwards I took a lesson in Arabic, which from my knowledge of Hindustani was extremely easy, the one possessing many words of the other, though the structure and grammar of Hindustani are different.

We were twenty hours on the water before we caught sight of any object. Then the look-out observed a dark mass far away to the eastward; and all the proas halted at the whistle of the Reis

Nizam, or to speak more correctly, Nizam al Reis. The chiefs of the other proas were all Malays, but had evidently great respect for Nizam, and obeyed him unhesitatingly. I sat cross-legged with Abou in the background, hoping to escape remark; but it seems that one of the Malays started the idea that being a white man I could see further than other people. So I was questioned, and disclaimed the power very earnestly; but I could not help remarking to Abou that the Reis possessed a telescope, and that I wondered he did not use it. I made use of the words 'long sight' to express telescope; but as Abou did not catch my meaning, I made it clearer by pointing out the thing itself, which I had noticed among a pile of other things in that part of the proa sacred to the captain.

There was a perfect shower of nods when I spoke, and Abou, at a word from Nizam, fetched the telescope, which was handsomely cased in bright yellow leather. I took off the case and adjusted the focus, took a long gaze at the little dark mass, and discovered it to be a fleet of large proas, the announcement of which was received with evident incredulity. Then I motioned to the chief to look himself, telling Abou to instruct him to close his left eye, myself steady the glass for him. He looked for a moment, and then turned round with a face of delight, shouting to the other chiefs, 'Shin!' a word which they repeated with intense rapture. I was rather bewildered by all this; but in taking a second look, I found that instead of being large proas as I thought, they were Chinese junks, and the pirates expected a rich haul. With hardly a minute's pause they were in their sampans, paddling away to their craft; and in a wonderfully short time the fleet was under full pressure of oars, steering steadily for the unfortunate Celestials. There was no hesitation, no sampan reconnoitring. They seemed convinced that there could be no resistance, and they dashed straight for the prey.

The chief Nizam looked at me with an approving air, and calling up Abou, made me explain as well as I could the properties of the telescope and the way to use it. The last I could do perfectly; and Nizam was evidently greatly delighted when he could arrange the focus for himself, which he managed to do with great quickness. But his questions as to the mechanism I could not well explain. I could only say that there were round pieces of glass arranged in a certain manner by the men whose business it was to make long-sights. This didn't satisfy him; but as I evidently could not tell more, he desisted, and told me to remain by Abou, who would take care of me.

In the meantime we were rowing steadily towards the junks, and closed upon them in about a day's chase. When we approached there was a dreadful noise of gongs and drums, rockets were discharged which did not go near us, and the sides of the vessels were manned by fellows having shields painted in the most terrific way. As soon as the brass swivels were discharged, and considerable havoc had been done, the warriors bolted and lay down on their faces. The pirates boarded them, and I had the curiosity to go too. The scene was not without its humorous side. Between decks the vessels were partitioned off into little cribs, in each of which was a merchant with his stock

of goods, his bag of silver, and his provisions. There wasn't room to stand or to lie down, and each man squatted in a ludicrous fashion awaiting with calmness the inevitable spoliation. This was most complete, and the proas were loaded with spoil of all descriptions. The Malays cut off the heads of the killed and I believe of the wounded. No slaves were taken. I asked Abou the reason. He said the Chinese were worshippers of devils, that they would not work, and if they were whipped, they would drown themselves. All day long and far into the night the process of transferring valuables continued, and at length, after a thorough ransacking, the junks were abandoned, and the proas were turned towards their home.

My old friend Abou said that to reach this world occupy about two days and a half; and indeed on the third morning we saw the blue cloud which was to be my future prison. I was making astounding progress in Arabic, but it was extremely easy to one who had mastered Hindustani, and the ideas which the Reis formed of my capacity from this circumstance were not deserved. Still I was glad of his high opinion, since I was very reluctant to work as the slaves worked at Gezireh, their duty being to pass through their fingers rotting masses of oysters and feel for the pearls. This island home of the pirates was called Gezireh, but this means simply island, and I have no notion what its real name is, nor have I ever found it named on any chart. I only know that as we speeded towards it, the island of Celebes was on our right and Borneo on our left, and I should guess it was about thirty five miles south of either. It was about noon when we entered a long narrow bay and the proas came alongside a sort of natural jetty of sandstone.

CHAPTER III.—ASHORE.

Following Abou ashore—being still under his directions—I waited patiently until the goods, the *spolia opima*, had been discharged and carried to a great storehouse. This took considerable time, and I was heartily tired of my position long before Abou came for me. Meanwhile I looked about me and found Gezireh not uninteresting. The place was clean enough, and the scenery magnificent. A semicircle of hills surrounded the little harbour, spurs of which came close to the water's edge on each side of the town, the range running beyond, and terminating in broad bluffs that went sheer down many thousand feet into the ocean. On the crest of one hill that formed a part of the eastern spur there was a rough sort of castle, seemingly built of mud and stones, and encircled by luxuriant vegetation. The hills were broken in the centre by a stream, which meandered pleasantly through the town, and on whose banks most of the huts were built. They were constructed on piles, for what reason I do not know. I thought perhaps for fear of snakes—though they could easily have twined themselves up—or on account of immodulations; but I learned from Abou that such things were unheard of. At length I formed the theory that the inhabitants were descendants of people who always built their houses in the water, as did the folks in the pile-huts of Lake Constance, and other Swiss and Italian lakes. There are now in South America and many

other parts of the world people who live in lagoons, who build in similar style, and it may be that these Malays are descended from them.

While engaged in examining the appearance of things, I forgot the fact that I was a stranger and a curiosity to the populace. I was aroused to a knowledge of the fact by the tittering of a group of children who had surrounded me, and who, emboldened by my forgetfulness, were about to oblige me with a shower of tiny darts from their toy sumpitans or blowers, which are just like a boy's popgun or pea-shooter. Hearing the sniggering, I turned round, and sent the urchins scampering away as hard as they could, one unlucky fellow falling in his haste. I ran to pick him up, which act was vilely misconstrued, for they all set up a terrible howl, as if I was going to eat their conratre. This mournful cry brought out the mammas in full force; and whilst I was endeavouring to pacify the three-year-old and stop his yells by caressings and strokings, I found myself confronted by a good-looking mamma of about fourteen, yellow as a cowslip, whose eyes blazed fury, and who poured forth a torrent of choice Malay on my head. Placing the child in her arms, I smiled my very sweetest to reassure her; and having examined her young hopeful's condition, and found all his limbs and vital organs perfect, and no blood flowing anywhere, she gave him a heavy spanking, just in the fashion of an English mother; after this she walked off with much dignity, not even vouchsafing a look at me.

I was somewhat disappointed, for I felt hungry, and had intended to ask for something to eat in the universal language of pantomime. But I was luckier than I deemed after all, for soon a girl about nine, as I should think, though fully matured, and probably the sister of the first, brought me out a cocoa-nut and four plantains, which I received with many thanks. I ate the plantains, and then looked about for some means of opening the nut, but not finding any, I endeavoured to peel off the green rind with my fingers, intending to crack the shell on a stone; but being a young nut full of milk, I could not get the rind off. So I was forced to look around for assistance, and soon found that the family to whom I owed the fruit were vastly diverted at my attempts. The head of the family, whom I recognised as a warrior in one of the proas (and indeed I could not help suspecting that I had cracked at him with the revolver), advanced with a broad smile on his face, and a knife with an immense blade, and with one tremendous slice took off the green top, which had nowhere hardened into a perfect shell, disclosing the inside like a cup filled with water. This I drank with great relish. The Malay spoke something to the girl, who brought another cocoa-nut, but evidently a ripe one, for the rind had split and was peeling off. One or two rapid twirls of the knife cleaned it off completely, and then with a single blow he split it in halves, and gave me one, giving the other to the little boy who had served as my introduction to his family circle. I took it with a profusion of thanks, whose purport he seemed to understand with dignified appreciation. On the bend of his arm there certainly was the scratch of some weapon, and I was more and more convinced that he was a man I had deliberately aimed at, and

been particularly vexed at missing. And as I ate my cocoa-nut I felt secretly rejoiced that he was not going to use his broad knife on my head by way of retaliation.

SWIMMING.

We recollect being strongly impressed many years ago with the desirability of having our girls taught to swim as well as their brothers, and of preparing for the whole family suitable and becoming dresses in which to bathe. Pater-familias, who had taught all his boys to swim and to dive—so that the little ones of six and seven years old were the wonder and admiration of the gazers on the beach—undertook to clothe himself in a suit made of thin scarlet flannel, and to give his daughters the necessary instructions to make them also skilful swimmers.

It was on the quietest and most primitive little sea-beach on the coast of Suffolk that this attempt to achieve a family gathering in the water was first made, and great was the fun and enjoyment of the first two lessons. The pleasant parties had, however, to be stopped, and the girls of the family left by their male relatives to flounder in the water as best they could, for the shopkeeping visitors to the beach from the adjacent town were so shocked at the unwonted sight of this 'un-English' display of the commingling of sexes in the sea, that they became a perfect barrier to the enjoyment. The pleasant amusement had to be abandoned, although the costume worn was decidedly more rigid than is often seen in an ordinary drawing-room, and much more rigid than that adopted at many an English bathing-place. So the attempt was abandoned for the nonce; and the girls of the party waited for their lessons in natation till they visited Dieppe on the French coast during the following summer, where it is not considered objectionable or improper for husbands and wives, fathers, brothers, daughters, and sisters to walk into the sea together and swim away side by side, or for ladies and their friends of either sex to enjoy an aquatic morning chat.

With the increasing sense of necessity for exercise and physical development in women, we gladly hail an improvement in the style and manner of bathing on our coasts. The cumbersome floating dress, which in itself was no protection, has given place to a neat, well-fitting, and decent sort of bloomer costume, which meets all the requirements of a bathing and swimming dress; and the bagbear of our childhood, the dreadful old, weather-beaten, half-salted bathing-women, who used to seize and plunge us in the water, stifling our cries, and almost terrifying us to death by dips—'One, two, and three,' before we could recover breath, has well nigh disappeared. In these enlightened days, it is seen that children will never take to the water or learn to swim if they are frightened into it; for one great secret of the art which we are advocating is confidence—repose—a sense of safety.

It is not possible to teach swimming through the medium of pen and ink; but some hints may be given, which, if put in practice, may supplement more practical lessons in the water. It is a very desirable thing to disarm every child's mind from fear of the water. To realise this fear, we have but to recall the well-remembered horrors of the

opening of the machine door on a vast waste of green water, with not an inch of land visible to our terrified gaze; and the splash of the dreadful geyser who was to seize and plunge us into this terrible abyss; and to contrast the joy with which the children of the present day trip down to the beach carrying their dainty little dresses—sure that mamma or nurse will see well to their safety while they gambol and play amid the crested waves, and thus learn to have no fear of the mighty deep, which, like many other things in life, is a fearful enemy to those who fear him; but to those who have learned his ways and his humours, and know how to manage him, is a delightful friend and playfellow.

It is a very good plan to learn to swim in any one of the many baths open now in all our large towns, for such as have not learned in childhood. At the Lambeth Baths in London, Miss Beckwith, the daughter of the proprietor, who is a skilful and graceful swimmer, gives lessons to ladies at certain times; and Mr Beckwith himself is an accomplished and able instructor. In the essential part of swimming, that is the art of keeping the head above water, there is really no skill required; confidence in the sustaining power of the water is the only secret; and if the novice will only dare to trust the water, and remember three simple rules, he cannot possibly sink: 1. On entering the water and attempting to swim, keep the hands and feet well below the surface, and immerse the whole body up to the chin. In France the teacher usually stands upon a platform which overhangs the water, and upholds the pupil by means of a rope which is fastened to a belt round the waist. As the rope passes over the end of a slight but tough pole, the teacher looks very much as if he were fishing for sharks with a human live-bait. Any mode of supporting the body will do excepting corks or bladders, which are a delusion and a snare, and raise the body unnaturally and too far out of the water. 2. Hollow the spine, and throw the back of the head on to the shoulders. The reason of this is in order that the solid mass of the brain may be supported by the air-filled lungs, and the eyes and, nostrils kept above the surface. The mouth should be firmly closed, and respiration conducted through the nostrils, so that no water can enter. 3. Move the limbs quietly.

A jerky, fussy swimmer is never a good one; and while he continues these habits will never accomplish any long distance or achieve any elegance in swimming. A slow stroke is the very essence of good swimming, and when endurance, not speed, is requisite, is the most valuable. There is nothing like the slow style for learning to swim; you may graft upon it all sorts of natatory accomplishments; but in time of danger the slow stroke is your sheet-anchor. Two novices who are wishing to learn to swim may, with a few practical directions, be very useful to each other. Of course the sea is the easiest medium for a beginner, on account of its being of a more buoyant nature than fresh water; but if you are not by the sea, why, you must go into a shallow river or lake instead. Walk in together until you are breast-deep; then let one spread himself upon the water, whilst his companion supports him with one hand under his chest. Lying on the water in this way he can practise the various movements easily, and when he is tired he can exchange duties with

his companion. It is astonishing how much can be done in a few days, and how soon the learner becomes independent of the supporting hand. As soon as the learner feels confidence, and that he has gained a mastery over the water, his companion should withdraw his hand, until at last its support is not needed. When the pupil can swim twenty yards in shallow water, let him try his mettle in water out of his depth, accompanied, however, by some good swimmer; but beginners should always make a practice of swimming *towards the shore* if possible, so that every stroke may bring them into shallower water as they get tired.

Practice in swimming, as in every other art, is the great thing to insure perfection, for as the swimmer feels his own safety in the water, and the almost impossibility of sinking if left to himself, he indulges in all sorts of gyrations and antics, to vary the monotony of simple progression. There are innumerable ornamental additions capable of being made to ordinary swimming. There is walking or treading the water, leaping like a goat, lying on the surface of the water, spinning round like a top; and a clever performer can turn somersaults in the water, 'carry his leg in one hand,' swim with his legs tied, and achieve numberless other remarkable diversions in the element over which he has attained mastery.

Swimmers should never remain in the water too long. We speak of course of amateurs who wish to enjoy the exercise for its own sake, and not with the object of accomplishing any feat of distance or racing. When such enterprises are undertaken they are as much a matter of preparation and training as any other athletic performance. Of late we have had notable instances of wonderful power of endurance, and that characteristic of the Englishman known as 'pluck,' in the remarkable feat of Captain Webb, who crossed the English Channel from Dover to Calais in a twenty hours' swim, without appliances, without trickery, without assistance, and as he says himself, 'as a British sailor should do.' Captain Webb has been delivering in various towns in England an interesting lecture on his own experiences; and as he is certainly the champion of swimmers, we may with propriety take his opinion as to the material of which good swimmers are chiefly made. The medical man who accompanied Captain Webb when he gave his lecture tells us that perfectly sound health and a temperate life, especially in the use of stimulants, is essential to the accomplishment of anything like a long-sustained effort in the water.

Captain Webb could swim at eight years of age; and he says the younger the pupil, the easier it is to learn to swim. At an early age the limbs are more supple and less stiff and difficult to manage than in later life. Captain Webb's father was in the medical profession; but his son's love for the sea was not thwarted by him, and the boy joined the ship *Conway* off Liverpool in 1857. It would be well indeed if every boy were compelled to learn to swim before he could join any ship, be it in the merchant service or navy; and a good rule for every family and school would be that no boating excursions should be possible for any lad who could not swim. Many sad and terrible accidents might thus be prevented. Captain Webb says that by a good swimmer, such as he would desire to see every English boy, he does not necessarily

mean a fast or brilliant swimmer; life-saving depends on a slow and steady stroke, and it is much more practically useful to be able to swim five or six miles in a suit of clothes, than to be the champion swimmer of five hundred yards in an incredibly short space of time. We would be inclined to think that even the comparatively short distance of a quarter of a mile in one's clothes, is what all ought to endeavour to achieve.

Much that we have already said about the best methods of learning to swim is endorsed by Captain Webb, who tells us that a slow, steady, powerful breast-stroke, known as the 'Eton stroke,' is the style to be encouraged, without hurry, without flurry; the hands being only second in the propelling movement in comparison with the feet, the heels touching each other after every kick, the hands placed flat on the water, the thumbs touching, thrust to the front full length, then slowly brought round square with the shoulders till the elbows touch the sides of the body, when the hands return to their starting-place between the chin and the breast.

Captain Webb's first notoriety was not gained by any planned effort, such as his swim across the Channel, but by a spontaneous act of British pluck, which deserves to be remembered. It was on the 22d April 1873 that he was a sailor on board the Channel steamer *Russia*, coming from America. A friend of the writer was on board; the vessel was going fourteen and a half knots an hour, the sea was 'houses high,' and the ship was rolling terribly, so that it was impossible to keep one's feet. 'Man overboard!' was the terrible cry that sounded through the wind and the waves. In a moment Webb was overboard, clothes and all, the idea of rescuing the poor fellow being his only thought. There was only his cap to be seen; and as the eyes of the passengers strove to see the man, only a vast waste of water was visible. Perhaps he had been struck by the screw or sucked under the vessel; certainly he was not on the waves, and Webb himself was almost immediately out of sight. His own sensations when he found himself left thus alone in mid Atlantic, he graphically describes. He could not and did not know whether any effort to save him was being made in the vessel he had left, or whether he too had been given up for lost! Home, friends, past events, crowded thickly into his mind; but he did not give up the effort to keep himself afloat, nor did hope desert him, though he felt that the very size and strength of the waves must shortly kill him. At last he sees a little speck on a far-distant wave. Can it be a boat? Yes. But the crew is rowing away from him back to the ship! They do not see him, and have given him up. He manages to shout to them, and they hear him and return. He has been thirty-seven minutes in a sea in which but few men could have survived, and is at last picked up by the boat's crew, without his man, and exhausted.

The excitement on board, it may be imagined, was great; and the ship's passengers made up a purse of a hundred guineas, which they presented to Webb as a testimonial of his gallant conduct. A sum was also collected for the relatives of the poor fellow on whose behalf Webb's brave but unsuccessful plunge was made. The silver medal of the Royal Humane Society was given to Webb; and in addition, he became the first recipient of

their highest honour, the Stanhope gold medal, which was presented to him by the hands of the Duke of Edinburgh on the centenary festival of the Royal Humane Society.

After some unsuccessful attempts, Captain Webb determined to make a resolute effort to swim across the Channel. The only training he had for this bold adventure consisted in taking plenty of good animal food, with a due allowance of fat, and three pints of good sound beer daily. He avoided spirits, tea and coffee, went to bed early at night, and remained in the open air all day.

On Tuesday, August 21, 1875, at one o'clock, Captain Webb left the steps of the Admiralty Pier, Dover, for his remarkable swim across the Channel to Calais harbour. Covering his skin well with porpoise oil, to prevent the excoxiating action of the salt water, he started at the rate of twenty strokes a minute. During his whole swim, he took no solid food—ale, beef-tea, and coffee being his only refreshments. He describes the incidents of the way very amusingly. For the first two hours he only met an empty flour-barrel and an old meat-tin, which persistently floated in his wake. Then the ship *Custalia*, homeward-bound from off which jumped the 'boy Baker,' who swam alongside for company to some distance. A school of porpoises were the next objects in his way; they took but little notice of him, and soon got out of his way, though from the scent of porpoise oil his 'dressing' gave out, they might have taken him for a friend. About half-past three o'clock, when he had been in the water two hours and a half, he had made five miles, and then settled down to a steady stroke of fourteen to a minute, feeling, he says, 'full of pluck.' A big steamer came by. She was a foreigner, and bound for Dunkerque. Foreigners cannot cheer—they shouted as well as they could; but the British seaman missed the ring of the British cheer. At a little past six he was joined by a small boat containing a well-known university oarsman, whose cheery words encouraged the plucky swimmer. Sun set at seven, and he describes the sunset and the soothing ripple of the waters as having the effect of almost sending him to sleep. But he must not relax. Half the task is done, and he is feeling 'right as a trivet.' It gets darker, and the moon has not yet shewn her silvery face over the sea; but the waves sparkle and shine with phosphorescence. Every stroke seems as if it were throwing away countless diamonds. Ah, Captain Webb, had you been a naturalist, you would have understood by this beautiful appearance that you were in the midst of troublesome companions, and need not have been perplexed and almost terrified on feeling a sharp, sudden, stinging pain in your shoulder, which, as you tell us, made you 'turn faint and sick.' The phosphorescence of the sea is produced by countless living or decaying organisms; sometimes by jelly-fishes, some of the large ones of which have the unpleasant property of stinging, and are hence called *sea-nettles*. The smarting and pain caused by one of these disagreeable visitors to our gallant captain, remained for hours, and the red mark on his shoulder lasted for days. The moon rose at ten o'clock, and Webb was the first to welcome her. The tide had turned again; other friends came out to meet him and to welcome him on his way, burning red lights in their boats, and telling him

that he was now but seven miles from the coast of France.

Another hour he laboured on. At two o'clock in the morning the mail-boat passed him from Calais. He saw the light on Cape Grimes, and it encouraged him on. It then became hard work. His face and neck were sore from the exposure, and were incrustated with salt. Day began to break, and he felt as if he must give in; but no; 'Do it or die!' seemed to ring in his ears, and on he went, swimming quicker and shorter. Every wave seemed to grow bigger. His hands were livid, and his legs felt as if they did not belong to him. Nine o'clock! Captain Dane is coming out of the Calais harbour to meet him, and has put his large boat on the weather-side, so that the waves no longer appear so formidable. The boat's crew cheer in true British style, and the heart of the gallant sailor, who has nearly finished his task, is cheered. Three hundred yards more—down goes an oar. No land touched yet. Another spurt. The oar touches the bottom! Well done, Webb! You have achieved a feat as yet unrivalled, and have landed on French soil, after a swim of twenty hours in the sea.

Webb's success induced others to emulate him, but without accomplishing the task. Cavill made the attempt, but had to give up after being in the water a few hours. His health and constitution unfitted him for the effort; and we believe that if such performances must be attempted, only those who are perfectly sure as to the soundness and power of their physique ought to try.

Independently of being able to swim, many lives would be saved if people would only learn to float. Man is the only animal that drowns unnecessarily. He does so because the knowledge he ought to possess does not come to his rescue, as does the instinct of the brute. A dog or a horse, or any other quadruped, when it finds itself out of its depth, swims away with its head above water, and usually gets safe to land. Man not finding himself in his natural position, is filled with terror, stretches his hands out of the water, which helps him to sink, or opens his mouth to scream, which fills his lungs with water instead of air. The result is obvious. If we could only have faith in the natural buoyancy of the body, and when cast unexpectedly upon the water, remain passively upon it, with the mouth tightly closed, many lives might be saved that are now annually lost.

THE LAIRD'S RELIEF.

IN TWO PARTS. —PART II.

MR ARMSTRONG of Clouseburn, banker, proprietor, and magistrate, sat in the study of his residence at Balgoyle in consultation with Robert Wilson, the chief constable, debating matters concerning the good order of the town during the three following days, which were to be devoted to the far-famed Balgoyle races. They naturally expected to have their hands pretty full during this season, and were chiefly anxious as to whether their force might be sufficient to deal with the unusual presence of a noisy crowd in the quiet town.

'By the way,' said the magistrate, having finished his official business, and, as was his wont, treating himself to a little gossip of which Rob Wilson

was a famous retailer, 'the Laird o' Brackenhaugh was in diving with me last night. He removed a quantity of valuable plate from the bank; I hope he will be sure to have it conveyed safely. Anything going on out there—eh, Wilson?'

'Ou ay, sir. There's to be grand doings out-bye. John Scott o' the Abbey linn has had sic an order as is like to send him wild; and Inglis the flesher has had an extra killin'. And there's been hampers frae Edinbro', and flowers, and I dinna ken a' what—let alone a band o' musicians. And what's mair, sir,' he added in a whisper, 'they tell me there's been siller to pay for it a'.'

'Hum, ha! Of course, of course.'

'And there's a grand party come frae the South—a coach-load and twa machines, with Miss Barbara at the head o' 'em'—'

At this moment there was a knock at the door, and the servant announced our friend Mr Simpson, who in an excited manner exclaimed: 'I want to see the magistrate.'

'Come, come, sir, state your business calmly, and proceed with caution,' said Mr Armstrong, who didn't like to be flurried. 'Who and what are you?'

'My name's Gabriel Simpson; but what I am at this moment I don't rightly know, your Worship.'

'Eh, what's this?' said the magistrate sharply, while the constable edged his chair round (he had seated himself to take down Mr Simpson's statement, at a hint from the magistrate), and eyed the new-comer carefully; for Mr Wilson was a very energetic man, and there was scarcely scope for his talents at a place like Balgoyle; and the criminals with whom he usually had to deal were so lamentably stupid that he had come to consider the sifting of evidence a matter for slow minds, and rather devoted himself to the inventive part of his business than the corroborative.

'Well, sir, I mean that last night I was a man in possession; but my situation is bust up, and I ain't hanythink, as far as I can see just now. And my business, sir, is *murder*, that's wot it is—wich his name is Wilkie;' and Mr Simpson looked as much as to say: 'Does that wake you up?'

'Murder!' exclaimed the other two.

'Tell your story, sir,' said the magistrate.

'Well, sir, as I was going to tell you, me and my friend Wilkie came down last night, and accordin' to instruction, proceeded to henter upon possession at the house of McLeen of Bracken-hog'—

'Brackenhaugh!'

'Yes, sir, Bracken-hog. It was Mr Wilkie's intention to have just put me up to a wrinkle or two, this being my first job, and the pore man was going away this morning, if all had gone well with 'im. But little we thought of the dangerous service we was a-goin' on! Little we thought of the desperate willins we was goin' amongst'—

'Come, sir, give us your facts.'

'Well, the facts was as follers. When we got into the house, we was at first alarmed by the shouting of Mr McLeen and his friends, who were shootin' of pistols and clashing of swords like anythink.'

Here the magistrate and the constable exchanged glances, and the latter eyed Mr Simpson curiously.

'We was both a bit frightened; but the ladies'—

'What ladies?'

'Missus Janet and Miss Phemie.'

'The housekeeper and one of the lassies, sir,' explained Wilson.

'They was werry kind, specially to Mr Wilkie; and indeed I think the pore man took more than was good for 'im, for he made such a noise that the gents up-stairs must have heard 'im. And through the kindness of the females I was able to get to my room before the murderers came down, and everything was so still afterwards that I thought pore Wilkie had escaped. I thought before I went to sleep that I heard a groan or so, but couldn't be sure. And in the morning, sir, when I woke 'O Lor!' and he turned whiter than before, and covered his face with his hands—'there was Wilkie a-hanging to a tree! A corp, your Wuship!'

'A very strange story, eh, Mr Wilson?' And the constable shook his head dubiously, sagely, inventively.

'But wusser than that, your Wuship. I should never have got away safe, but for a villain, a tall red-haired man'—

'That'll be Donald the Hielandman, likely,' interpolated Wilson.

'He mistook me for one of the murderers, I believe, sir, and—and—he talked of hanging as an excellent joke, and invited me to be present when they were a doin' hup "the other man"—meaning me, your Wuship; and he shuddered at the thought of what he had escaped.

'So then you charge Mr McLean with the murder of your friend, eh?'

'Him and his friends. Yes, sir.'

'Did you see Mr McLean?'

'No; but I 'eard 'im, sir.'

'Oh! you heard him, did you? What do you think of all this, Wilson?' said the magistrate, looking suspiciously at Mr Simpson.

'Case for further inquiry, sir. Shouldn't wonder, sir, if it was a plot of some kind—suspicious-looking character, very,' he added in an undertone. 'I'll keep an eye on him.'

After some further conversation, in which Mr Simpson answered sundry questions that were put to him, he was about to retire, when the maid-servant entered with a very red face, and eyes suffused from suppressed laughter.

'Another mon, sir; and he told me I was to give ye this card,' and turning away her face, she smothered down a laugh with her apron.

Mr Armstrong started on reading the name on the card, and handed it to Wilson, who immediately said: 'I thought so. Owre clever, as usual. Perhaps I'd better go into the parlour, sir, and sit with this gentleman a bit;' and he motioned Mr Simpson to a side-door in a way that savoured rather too much of the 'move-on' formula of a later date, to be quite pleasing to that youth.

No sooner had they retired than the cause of the servant's hilarity became apparent. The door opened, and there entered the subject of the late inquiry, Mr Wilkie; but how different from the spick-and-span Wilkie, the idol of the tea-tables about Nicolson Street and the South Side of Edinburgh! Unshaven, unkempt, travel-stained, he might even still have carried matters off; but how was he to hold up his head in the costume which met the astonished gaze of Mr Armstrong! Full Highland dress made for a man twice his size, kilt wisped round him tight, foldless, dragged; hose, unfilled by the accustomed calf, hanging

flaccid and uneven; a plaid cast round his shoulders as a schoolboy wears a woollen comforter; and a bonnet with an eagle plume and crest stuck jauntily on one side of an uncombed shock of hair that surmounted a face expressing profound humiliation.

'What's the meaning of this foolery, sir? Are you drunk or mad?' said the magistrate angrily.

'I may weel be baith, sir, or it'll no be lang first. I'll no haud my head up again. Sic doin's, sic doin's!'

'How dare you come and play off your fool's jokes upon me in this manner?'

'Jokes! jokes!' exclaimed the unhappy bailiff.

'Gin you's a joke, a kirkyard's a place o' revelry and mirth. Look here, sir. I'm a quiet man and an orderly, and I don't mind the time when I couldna tak a freendly glass and keep my wits. But sic a night as last! Mairey on's!' And then Mr Wilkie told the story of his mishaps, which, for the better understanding of the reader, we give apart from his comments and reflections. His recollections of the previous night's occurrences were rather dim, and up to the time of his waking he only remembered that he had fallen under the table in the housekeeper's room at Brackenhaugh, and had been assisted to his bed by a man and a boy. Overcome by his potations, he had slept till shortly after daybreak, when he was aroused by the sound of knocking at his door. Jumping up, and holding it ajar, he was addressed in tones of frightened entreaty by Phemie to leave the house without delay, as there had been an awful crime committed, and she could not tell but that he might be the next victim. Believing that he had created rather a favourable impression in this quarter, and unminful of the events of the previous night, he could not suppose that it was other than an interest in his welfare that had actuated the young woman to warn him in this manner; and when, in horrified accents, she had told him how his companion had been foully made away with, he lost no time in preparations for flight. On looking round the room, however, he found that all his clothes had disappeared, and on mentioning this to Phemie, she seemed more terror-stricken than before, saying that that had been done, she supposed, in order to do away with any possibility of his escape; but he should never say 'that Phemie didna dae a' in her power to save his life;' and that she had thereupon flung the articles of clothing in which he now appeared into the room to him, and he had arrayed himself in them as best he could. To make more sure, he had on his way out visited the room in which his friend Simpson had slept the previous night; but it was empty, the furniture and bed in disorder, and blood-stains visible upon the floor and bed-curtains. He would not enter upon the sufferings he had since undergone—how he had lost his way; how he was driven away from farm-houses by dogs; how the driver of the coach had refused to take him, and had merely flicked him on the legs, with the observation: 'Hoot awa', daffie!' how he had been followed by the crowd in Balgyle, and claimed as a cousin by a real idiot—one Daft Willie—who paraded the streets with him arm-in-arm, in spite of all his endeavours to avoid it. All these things, he said, were more than enough to have taken ten years off his life.

Mr Armstrong listened to all he had to say with attention, asked a few questions, and then requested Mr Wilkie to follow him. Going out of the door by which he had entered, the magistrate ushered him into a room looking out into the main street, where Mr Wilkie had the pleasure of seeing a crowd of boys and idlers gathering, in evident anticipation of some fun to be got on his reappearance.

Mr Armstrong returned to his study, and called the constable to him from the next room, and shortly related to him what he had heard.

'Now what do you think of it all, Wilson, eh?'

'Well, sir, my settled conviction is, that it's just a scheme to weaken the constabulary of the town. He's one of your regular London ones, is that Mr Simpson?'

'Bless my soul! do you think so?'

'Ay, that I do, sir.'

'But they wouldn't have the impudence to put their heads in the lion's mouth in this manner!'

'Ay, sir, the honestest it looks, the deeper I believe the scheme to be—fræ a lang experience, sir.'

'But what could their object be?'

'I never fash myself to find an object, sir—at first. It might be anything. There may be accomplices amongst some of the people that will be here at the race-time. It may have to do with the Laird of Brackenhaugh's plate. It may be a plant to discover our force in the town, and give them a better chance of plunder.'

'Dear me, yes; that's serious.'

'I think, sir, the best plan will be just to keep a watch on them for a day or so at least. It can do no harm, for there is suspicion enough to warrant their detention. We can make inquiries; and at any rate, as there has clearly been no murder at all, and it's as like as not to be a thievish scheme of some kind, we may net the whole gang possibly.' And Mr Wilson's chest expanded and his face lighted up as delicious visions of a *grand coup* and subsequent promotion came before his mind's eye.

'Perhaps so, perhaps so. I think the circumstances justify their arrest. Very suspicious altogether.'

'And I think, sir, it might be best to keep them unacquainted with what we know. There's no telling what other inventions they may have by which we can get a clue.'

'Yes, yes; use your own discretion in that matter, Wilson.'

In an hour from this time, Mr Wilkie and Mr Simpson, despite their entreaties, protestations, and threats of action for false imprisonment, were occupying separate rooms in the lock-up of Balgyle—in quarters rather superior to those occupied by ordinary malefactors, but still sufficiently guarded by bolts and bars to prevent escape.

For two days and nights they languished in their confinement, each believing in the demise of the other, and vaguely wondering in what way they could be suspected of complicity—which was darkly hinted to them from time to time by Rob Wilson the constable. The expected accomplices not turning up, and satisfactory answers having been received to the inquiries forwarded to headquarters at Edinburgh, they were ultimately released. It was with unfeigned delight that the two men recognised each other in the flesh.

'But what was the body I saw 'anging to the tree?' said Mr Simpson.

'Perhaps this,' said the other sleepishly, as he pointed to a box that had been left for him in the care of the constable, containing his clothes—a great joy to him—stuffed, and with a turnip head, to which a cut cord was attached!

'But how about the blood-stained room?' inquired Mr Wilkie.

'Perhaps this,' said Mr Simpson, pointing to a smaller box received by him, and containing the corpse of a decapitated fowl!

So pleased was Aunt Barbara with her reception at Brackenhaugh—knowing, too, or rather having found out, during her sojourn, that things were not going so smoothly as could be wished, despite the energetic efforts of the housekeeper to throw a cloak over the nakedness of the land—and so pleased was Janet with her stratagem that she took the Laird on one side before his aunt's departure, and urged him 'just to speak up, and tell his dear father's sister his trouble;' which having done, he could not forbear telling her also of his recent deliverance by Janet's means; upon which the old lady requested Janet to give them a circumstantial account of the whole story.

'But,' said Aunt Barbara, as she wiped the tears of laughter from her eyes at the conclusion, and as she handed the housekeeper a ten-pound note to buy a silk gown, 'who were the two fighting culants, Mistress Janet?'

'Jest Donald and Niel the gairdner and the bit laddie, mem; and thank ye.'

FIRE-KINGS AND FIRE-EATERS.

WHAT are the hottest things we can swallow without dread disaster to the throat and stomach? Can we handle red-hot solids, and wash our hands in white-hot liquids? Can garments made of woven materials be rendered fire-proof, in a complete or even a partial degree? These are questions worthy of notice; for though it matters little whether or not we attend an exhibition at a place of public amusement, it matters much to know how far and in what way burning may be avoided when fire is raging.

The ancients had more knowledge of this matter than we sometimes give them credit for; and the middle ages in like manner were marked by many incidents illustrating a real or pretended power of bearing intense heat with impunity. Albertus Magnus mentions many feats of exhibitors or trading sorcerers, in which the hands and the interior of the mouth were washed with certain heat-resisting liquids; while in others nothing more was displayed than clever conjuring, men seeming to do what they really did not.

A letter is extant from Sir Henry Wotton to Sir Edmund Bacon, in the time of Charles I., mentioning a Twopenny Exhibition in London, in which 'an Englishman, like some swabber of a ship come from the Indies, who hath learned to eat fire as familiarly as ever I saw any eat cakes, even whole glowing brands, which he will crush with his teeth and then swallow.' Later in the

same century was an exhibitor, one Richardson, who gained much notoriety by this kind of defiance of fire. This appears to be the man mentioned by Madame de Sevigné. He waited upon her from Vitry, and dropped into his mouth melted sealing-wax 'as if it had been so much cold water,' without the slightest semblance of pain; nor did his tongue shew the least sign of burning or injury whatever. The lively letter-writer, while treating the display almost as a miracle, nevertheless asked in a half-bantering tone what would become of the proofs of innocence, so much depended on in former ages, from the ordeal by fire. Richardson probably exhibited his marvels in various parts of Europe; for Evelyn was present at one such display at Lady Sutherland's. After dinner, the fire-king devoured flaming brimstone by way of dessert; chewed and swallowed burning coals; melted a beer-glass and then ate it up, or drank it down; put a live-coal on his tongue, placed an oyster on the coal, blew this strange substitute for a fire-place with bellows, and so continued until the oyster was roasted or scalloped; he melted pitch and wax with sulphur and drank off the mixture in a flaming state; and finally held a thick piece of red-hot iron between his teeth. A learned French publication, the *Journal des Savans*, gave detailed accounts of many of Richardson's marvels; and in the same journal, M. Panthot afterwards explained how they were done, according to revelations made to him by Richardson's servant. The exhibitor rubbed with some chemical substance the hands and other parts of the skin to be exposed to the fire; the powerful liquid hardened the scurf-skin into a kind of leather; and after many repetitions of the experiment, this hardening became permanent. Some blacksmiths, it is known, can handle a piece of iron nearly red-hot, the skin of the hand having become indurated by long practice at the hot trade. In roasting bits of steak and raw oysters on his tongue, Richardson is said to have secretly placed a thin slice of veal between the tongue and the burning coal; and that this and the moisture of the mouth shielded him from injury. As to swallowing such dainties as flaming sulphur and pitch, he was wont to retire immediately from the audience, drink off warm water and oil, and so obtain relief by an emetic.

Early in the last century a fire-eater named Heiterkeit exhibited in London; but all we hear of him is that he had the honour of appearing before three or four members of the royal family. About the middle of the century the great hero in this line was Powell, who was visited and described by Strutt. Although eighty years of age, this man would take burning coals from the fire and eat them; place a bundle of lighted matches in his mouth, and blow out the sulphur-fumes through his nostrils; carry a red-hot heater around the room between his teeth; broil a piece of beef-steak on red-hot charcoal placed on his tongue; and drink with an iron spoon a delectable beverage consisting of blazing hot pitch, wax, brimstone, and lead. There was a little wagery in some of the descriptions of Powell's tendencies: 'His common food is brimstone and fire, which he licks up as eagerly as a hungry peasant would a mess of pottage. He feeds on this extraordinary diet before princes and peers to their infinite satisfaction; and such is his passion for this

terrible element, that if he were to come hungry into your kitchen while a sirloin was roasting, he would eat up the fire and leave the beef.' We may fairly surmise that Powell adopted some such precautionary measures as his predecessor Richardson.

About the same time, the beginning of the reign of George III., several scientific men made some valuable experiments to ascertain what degree of heat the human frame could endure for a short time with impunity—apart from any sophistication or secret preparation. MM. Duhamel and Tissot recorded their observations on a young girl, who entered an oven, and remained there ten minutes at a temperature of 288° F., and on another who braved a heat of 325° F. for five minutes. Dr Solander, first clothed and then unclothed, remained for some minutes in an oven at 210°; Sir Joseph Banks at a little higher temperature; and Dr Blagden at 280°. Eggs were at the same time roasted hard in a few minutes, and a beef-steak baked (for it was really baking) in about half an hour. The experimenters could not touch any of their metal buttons or buckles without burning their fingers. All the temperatures here named, except one, greatly exceed that of boiling water.

Sixty or seventy years ago there was a Signora Girardelli who astonished the sight-seers of London by standing with her naked feet on a plate of red-hot iron; drawing a similar plate over her hair and tongue; washing her hands in boiling oil; putting melted lead into her mouth, and keeping it there till it solidified—or so it seemed to the spectators at any rate.

A famous man was M. Chabert, the fire-king, fire-eater, and 'poison-swallower,' rather less than half a century ago. By trade a baker at Paris, he gained much notoriety by his fire-resisting qualities. According to the stories told of him, he would rush into a burning house and bring out the inmates. Once, passing a smith's forge, he took out a white-hot piece of iron with his naked hand, placed the end on an anvil, and bade the smith hammer away; the son of Vulcan, too much alarmed, ran away, fearing that a denizen of the nether regions had made his appearance. For a time Chabert was inspector of the royal kitchen at the Tuileries; but he was prone to go into the heated oven and give out the dishes of baked viands with his hands; the king, fearful of sad results from such proclivities, discharged him with a small pension. He went to Vienna, and in the presence of the imperial family, sat in a tar-barrel flaming and smoking, until he was blackened like a negro. Coming to England, he exhibited at White Conduit House, where he entered a huge oven, took in a leg of mutton, shut the door, sang some French songs, and came out with the mutton baked. On other occasions he bore the heat of an oven raised to 500°. Repeatedly he swallowed phosphorus and prussic acid, or appeared to do so; but when Mr Wakley, editor of the *Lancet*, proposed to administer the last-named powerful poison as a test, Chabert refused to comply. This and other circumstances led to the failure of the fire-king as a profitable exhibition. There is no doubt that the man possessed exceptional personal peculiarities; but it can as little be doubted that he supplemented these by precautionary measures, such as we have already mentioned.

Scientific and practical men have devoted much attention to the utilising of these peculiarities. Messrs Versmann and Oppenheim have shewn that textile goods for apparel, if impregnated with tungstate of soda, acquire a remarkable and valuable power of resisting flame. The ordinary fireman's smoke-dress will resist much fiery heat, and still more fume and smoke. Dr Tyndall's fireman's respirator is a useful aid in the same direction. Lieutenant Champy has introduced a very ingenious protective dress for French firemen.

The new aspirant for fame as a fire-king, Captain Ahlström, is a Swede, who came to England to display the fire-resisting virtues of a dress devised by M. Östberg of Stockholm. It certainly is about as daring an exhibition as can well be imagined. A wooden structure is built up, supposed to represent the frame-work of a cottage, which is roofed and filled with combustible and inflammatory materials. When this has been kindled into a blaze, Ahlström, clad in his fire-proof dress, enters the burning pile, walks leisurely about, and seems to be as comfortable as if the temperature were only 60° or 70° F.; he brings out red-hot and blazing timbers in his hands, sits down on a half-burnt and still blazing wooden chair, brings out a 'dummy' human being wrapped up in a mantle, chops down burning timbers with a hatchet, and spends something like half an hour in these apparently agreeable pastimes. The fire-dress which enables Ahlström to pass through this ordeal may be said to comprise its own fire-engine within it. Outside his ordinary dress he dons two garments, one covering the head and neck, the other the body and limbs, and meeting at the waist. These garments are double, an inner layer of india-rubber, and an outer of moleskin lined with stout cotton cloth. A casque or helmet of double canvas comes down over the headgear, and joins a breastplate made of similar material. Air circulates between the inner dress and the body, and escapes through holes in the upper part. This air is supplied in a curious way. Ahlström, when fully equipped, has a tail of portentous length, consisting of two concentric pipes—an inner india-rubber tube into which air is fed by bellows or an air-pump, and an outer hose filled with water. There is also a flexible pipe extending from the helmet to a forcing-pump. The whole dress is drenched with water while he exposes himself to the heat; and he has an auxiliary hose with which he can plentifully saturate any objects around him. The water keeps the garments down to a supportable temperature; while a constant supply of fresh air within the dress prevents the wearer from being too much incommoded by the steam generated. Forcing-pumps, or analogous apparatus, both for air and water, appear to be indispensable. The wearer looks through holes in front of the casque, kept cool by water outside and an exit current of air from within. No preparation is applied to the skin; the wearer relies on his garments, the constant pumping in of fresh air, and the constant flooding of his exterior with water. Of course the soundness and good working condition of the tubing, &c. are essential matters; but, these being properly attended to, there seems no reason to doubt that this ingenious invention would be useful for the purpose intended by Östberg and Ahlström—namely, to enable firemen and salvage-men to enter buildings under circum-

stances of flame and intense heat. Practically, however, the dress, &c. would be useless in any emergency where an air-pump and a water-pump were not at hand.

LOOK TO YOUR MILK.

How to manage the sewage of towns and villages is becoming a matter of serious concern. Rivers are polluted, little innocent rills of water are polluted, water-cisterns are polluted, and what one would never have dreamt of, the milk used at breakfast and tea runs a fair chance of being polluted. On all hands you are beset with poisonous gases, invisible to the eye, and perhaps not perceptible by the nose, but which create typhoid fever and diphtheria to an extent that is becoming in some places alarming. Nature has designed that certain kinds of offensive matter should be as speedily as possible buried in the ground, not only for the sake of putting it out of sight, but in order that the gases created by its fermentation and dissolution may be absorbed and made use of in the vegetable world. Processes of this nature are superseded by what everybody understands by the word sewage: behold the consequences! Men are clever, but they cannot overreach Nature. We are not, however, going into a dissertation on sewage. All we propose to do in the meantime is to ask people to look to their milk; for through that channel, as will be seen by a short statement, there may arise very fatal epidemics.

Such an epidemic broke out during the past year in Eagley, a small village near Bolton, Lancashire, and one which extended into Bolton itself, and embraced no less than two hundred and five cases of sickness from typhoid fever, twenty-two of which cases terminated fatally. The official Report of Mr Power the government inspector into the causes of the outbreak, just issued, shews a combination of circumstances which cannot but be viewed with alarm by all who take an interest in the social condition of the people, but an alarm which, if it leads to action in the right direction, will be of a beneficial character. Mr Power, in his Report, states that the village of Eagley, in which the outbreak of enteric fever commenced, has a population of sixteen hundred and twenty-five persons in three hundred and eighteen dwellings, and shews that the local sanitary arrangements are by no means satisfactory. It has a deficient water-supply; there is no system of sewage existing in the district; and surface-drains carry off all slop and rain water to the nearest water-courses. He then proceeds to deal with the specific epidemic of typhoid and its causes. It appeared that 'of fifty-seven families supplied with milk in Eagley from a particular dairy, no less than fifty-five (96 per cent.) were attacked by fever; while of two hundred and sixty-one other families in the same district, supplied from other sources (or not taking milk), eight (3 per cent.) only were attacked. As regards these eight families attacked by fever though not taking the milk, examination of the circumstances of their attack served but to add additional force to the evidence implicatory of the particular dairy. In

six of the eight, the members attacked had, prior to their illness, partaken at neighbours' houses of the milk in question; in another of the eight, the disease, though called "fever," had not been medically recognised as such, and the origin of the disease, whatever it was, could not be traced; and in the last of the eight exceptional cases, the fever occurred at a later period in April, and was referred by the medical man in attendance to the use for drinking, of water presumably infected by pre-existing cases of fever. "Further, in several instances, persons not residents within the area of the milk-supply were, after partaking exceptionally of this particular milk while visiting friends in Egley, attacked by fever.

"The evidence connecting the outbreak with the milk-supply is strengthened by the special incidence of fever on habitual drinkers of raw milk. Particulars of the habits as regards milk consumption by individuals were obtainable respecting thirty-five families, comprising one hundred and sixty-one persons. Of these, eighty-three habitually drank milk in a raw state, while seventy-eight took it in tea or coffee, or did not take it at all. Of the former, seventy-nine (93 per cent.), and of the latter, eighteen (23 per cent.) were attacked. As regards the characters of the milk in question, so far as they were of a nature to be recognised by the consumer, it has to be noted that the milk was almost unanimously voted poor, and many persons complained that it had an undue tendency to become sour. Towards the end of January last, it was generally noticed that something was wrong with the milk; it turned sour almost at once, and is described as having been of a peculiar colour, to have tasted unpleasantly, and even to have smelt offensively. In many instances the milk, after standing left at the bottom of the vessel containing it a sediment variously described as grit, sand, or dirt." This evidence seems conclusive that milk from the dairy in question has in Egley been concerned in the dissemination of fever; but the operations of this dairy were not confined to the Egley district. Half of the total milk of the dairy was habitually retailed in Bolton town, two or three miles distant. This fact, shortly after the outbreak of fever at Egley, became known to Mr Sergeant, Medical Officer of Health for Bolton, who forthwith undertook inquiry respecting the distribution of this milk within his district, and found that wherever in Bolton this milk had been consumed, there also had been fever. 'The localities,' said Mr Sergeant, 'shewed that the disease followed unerringly the track of the milk-supply from the particular farm. Not one household to which the milk was traced was entirely free from disease; the houses, clean or dirty, were attacked indiscriminately.'

As to the causes of the impure milk traced to this particular dairy, Mr Power explains that it was established beyond a doubt, from close examination of the farm itself, that the only water used for dairy purposes was taken from a brook into which organic matter and filth drained, rendering it exceedingly foul. A different class of water was used in other farms in the Egley district; and though in these cases the water was bad enough, still there was not the specific contamination existing in the water supplied to the farm from which the infected milk emanated. Mr Power concludes his Report thus: 'It hardly appears

needful to insist on the chief lesson taught by the foregoing history. The case is simply one more, and a serious one, added to those cases already on record which point to the urgent necessity for regulation and adequate supervision over the sanitary circumstances of dairy-farms.'

The importance of Mr Power's concluding recommendations cannot be too greatly estimated, or too forcibly pressed not only upon the attention of our local authorities, but upon government itself. We have laws enforcing the inspection of mines and their proper regulation, to insure the safety of the worker; in cotton-mills and iron-foundries, all working machinery is carefully fenced round to avoid accidents; the laws relating to the transit of combustible material by road or sea are strict, and rigidly carried out; the indiscriminate storage of gunpowder, petroleum, and other dangerous substances, is guarded against; and indeed the British subject seems, as it were, to be carefully surrounded by a *cordon* of statutes protective, as far as they go, of both life and limb; yet we cannot but think that all these are comparatively of small moment when, at the same time, death and disease may be dealt out unconsciously at the morning and evening meal from the milk ewer.

ON THE TAKING OF FOOD BY AQUATIC ANIMALS.

In the study of animals, it is sometimes the case that, while having our attention occupied with the principal function of a particular organ, we overlook, or consider but lightly some other functions which belong to it as truly, though they may, when recognised, appear subordinate. Thus the gills of fishes are naturally, perhaps only associated in our minds with the process of respiration in these animals. The truth is, however, that they serve other important uses connected with the taking of food (which, it must be remembered, is an essentially different physical process in water from what it is in air); and the study of these, in which we are aided by the recent observations of a German naturalist, M. Jäger, is highly instructive.

When a fish snaps up an object it first opens its mouth and closes its gill flaps; and opens the gills when it closes the mouth. When it wishes to reject a disagreeable morsel, on the other hand, it first, with closed mouth, opens the gill slits, and enlarges the mouth-cavity, then shuts the gill slits and simultaneously opens the mouth. By narrowing the mouth-cavity throughout its length, it now forces out the contents; and in doing so, it is driven a little backwards by the reaction, like a cannon when it is fired.

If we think of it a little more closely, we shall see that, without the gill slits, the fish could not snap up any object, and so could not eat, because the morsel, if it got into the mouth-cavity, would, on closing the mouth, be ejected. The reason is simply this: On opening, the mouth-cavity fills with water after the manner of a pump, and the morsel is taken in through suction of the portion of water in which it floats. It can now be held fast in the mouth only if the water finds a mode of exit so narrow that the morsel cannot escape along with it. For this the mouth slit is nowise fitted, for if it be closed, so that a small morsel cannot escape by it, it affords no easy outflow

for the water. But the want is fully met by its gill apparatus, which presents a double row of long narrow slits, each of which is generally a good deal longer than the mouth slit, so that the water can readily flow away without the morsel being carried off along with it.

But again, if a fish were obliged to eject by its mouth the water it had taken up, it would be driven backwards at each bite, and have to expend force wastefully in recovering its ground by swimming, which would be specially disadvantageous in flowing water. On the contrary, however, as the water flows out backwards through the gill slits, the fish receives each time an impulse which drives it forwards, and the maintenance of its position in rapid water is thus rendered more easy.

From these considerations, it becomes possible to explain a number of the arrangements found in aquatic animals, as compared with those which live in air.

Still regarding the finny tribes, we find remarkably large gill slits in fishes of prey; and any one who has watched a pike or a trout in pursuit of its prey, will have noticed how widely it has stretched its gill slits, so as to let the water flow off as freely as possible on all sides. If this were at any moment to accumulate in the mouth-cavity, the fish's motion would be seriously compromised. It may with certainty be said that all fishes with remarkably wide gill slits hunt their prey in long pursuit. Thus, among our fresh-water predaceous fishes, the pike makes the longest pursuit and has the widest gills. As a contrast we might take the gently feeding and nibbling plant-fishes, such as barbel, carp, &c., which have narrow gill slits.

A similar difference is associated with the streaming of water. As a fish always snaps with its mouth against the current, it receives more water into the mouth the more rapid the current; and therefore river-fishes have in general larger gill slits than fishes which live in still water. Thus too may be explained the remarkable correlation between the width of the mouth slit and that of the gill slits, inasmuch as narrow-mouthed fishes have narrow gill slits, and wide-mouthed fishes wide gill slits. It is clear, then, that the gills in fishes fulfil an important function in the taking of food, just as truly as lips, teeth, tongue, &c. in higher animals. Now it is interesting to inquire how those animals (amphibia, reptiles, and certain birds and mammals) have been provided for that are without gill slits, and yet seize their food under water. A simple arrangement is that in which the mouth-parts for seizing are long and narrow, so that on the one hand the water has free escape to the right and the left, and on the other, very little water is compressed in the act of seizure. This explains the dagger and knife-shaped bills of all swimming and wading birds which prey on fish, as also the extremely narrow, bill-like snout of the dolphin, and the broader indeed, but more deeply slitted snout of the crocodile.

Another substitute for the gill slits is afforded by certain arrangements in the mouth slit, with which either the morsel is seized before the mouth slit is closed for the passage of water, or which permit the separation of small bodies out of the mouth-water. This rôle is played by long teeth, such as those of dolphins, crocodiles; the laminated bills of geese and ducks, &c. and the balcon of whales. In these animals may also be noted

a remarkable deficiency of the lips, so that even when the mouth is shut the teeth so to speak remain visible; and there is no outer mouth-cavity. The lips would here only hinder the escape of the water.

With regard to our gill-less amphibia, it may first be remarked that they seize a great part of their food in the air, or (which comes to the same thing) on the surface of the water. If they be observed feeding under water (which indeed is done almost only by newts) their awkwardness in comparison with fishes is very apparent. They cannot bring the morsel at once into their mouth, even though the mouth slit is comparatively large. It may also be noticed that they prefer large morsels, which are seized by the teeth, while yet the mouth slit is widely opened; whereas the small pieces which a fish swallows with eagerness and ease are either disregarded, or the attempt to snap them up fails, the morsel being carried out again by the returning water: this proves that the eating apparatus of amphibians is better adapted for land than water. This incapability of the newts appears more clearly if one watch the feeding of their larvae, which are provided with gills. In this stage of its existence the newt seizes its prey with the same rapidity as a fish.

THE INVINCIBLE LOVER.

My heart shines like a May day bird
That wons in leafy groves,
And lightly doth the burden bear
Of half a score of loves.
My heart shines like a May day bird,
And will not stint its joy
For all the laughing maids on earth,
That smile to work amoy.

On Youth's like a triumphant king,
I gaily still can ride;
Nor need I part from Nature's charms
To seek a meaner bride.
The morning sun, the radiant eve,
Are dearer far to me
Than any rosy cheeks, or lips,
Or bright love-rolling eve.

Yet not unapt in Love's sweet viles,
Nor dunes unskilled to sue
Nature's my mistress and my queen,
More gracious and more true.
On her green hills—a nuptial couch—
Through dewy evening hours,
I woo her western winds, and hold
Soft dalliance with her flowers.

No jealous fears disturb my breast,
But with a large consent
Rich favours I receive, and them
Receiving am content.
All seasons and all times she owns
My love with heartfelt tie;
In her embrace my life I pass,
In her embrace shall die.

A HOLIDAY IN AN OLD ROMAN CITY.

WITH the exception of those who have made the Roman antiquities of Britain a special study, very few are aware even of the existence within easy distance of London of one of the most important of the cities of Roman Britain—a prominent military station, and a chief link in the great chain of communication which, following out a fundamental law of Roman colonisation, connected the northern with the southern and the eastern with the western districts of the island. Still less is it known that, although for the most part buried beneath the surface, this city, which is now termed Silchester, is nevertheless easily traceable throughout its entire outline; the walls still subsisting in unbroken circuit; the gateways, with a portion of their substructures still discernible; the lines of streets in part laid bare, in part clearly marked out under the yellowing cornfields; several of the buildings, public and private—temples and baths, shops and dwelling-houses—exposed to view; the Forum carefully restored in all the details of its ground-plan; and evidences everywhere apparent that there needs but judicious and careful examination in order to complete the restoration of this long-forgotten city of the past.

More than a dozen years ago we gave an account in this *Journal* of excavations which had then lately been made on the site of the Roman station of Uriconium, now called Wroxeter, in Shropshire. The interest created by these explorations, although their extent was very limited, drew attention to the very similar remains of Silchester in North Hampshire, which had long been known to antiquaries, and especially to students of ancient coins, but had never been subjected to any careful or systematic investigation.

The site once occupied by this Roman station (anciently, according to the most probable opinion, called *Calleva Atrebatum*, but in Saxon times known as Silchester or 'The High Camp') now forms part of a large farm on the Stratfieldsaye estate of the Duke of Wellington, about ten miles from Reading and six from Basingstoke. But as

in the case of Uriconium, the details of its past history, and the circumstances of its foundation as well as of its decay, are almost entirely unknown. That it was a place of some importance before the Roman period is rendered probable by the discovery beneath the Roman pavement and its foundations, of other foundations of older date and of different workmanship, composed of rough flint stones and gravelly mortar; and that these deeper structures were of British origin may be inferred from the discovery amongst them of British coins in good preservation. But with the exception of a few allusions to it in the itineraries, no ancient notice is preserved; nor beyond some vague traditions of a Saxon inroad in which the city was destroyed, is anything known with certainty as to the circumstances of its decline and ultimate decay; and it presents at this day the same perplexing problem, the solution of which, in the case of Uriconium, has been vainly attempted by antiquaries—of the silent and unobserved disappearance of a strong and populous city without any well-marked catastrophe of war or of natural causes to account for its ruin. Here, as at Wroxeter, in the progress of ages the vegetable soil has silently accumulated above roadways and buildings, and the pavement of the streets and the floor-tiles of the private dwellings are to be found at a distance of several feet below the waving grass or the luxuriant corn.

That an ancient city existed on this site has been long known, and has been a subject of speculation from as far back as the time of Camden. The occasional discovery, in ploughing, trenching, and other farming operations, of coins and other relics served to keep the interest alive; and at various intervals during the last and the beginning of the present century, some portions of the ruins have been subjected to partial examination. But the new interest created in them is due to the works which have been undertaken since the estate has come into the hands of the present Duke of Wellington. In the year 1864, on the death of a Mr Barton, who had been tenant of the farm on which Silchester is situated,

the Duke became the purchaser of a small but interesting collection of coins and other antiquities which had been formed by Mr Barton during the course of his tenancy. It was ascertained, moreover, that structures of considerable extent had been struck by the plough in a spot which appeared to have been the site of buildings of some importance; and under the intelligent superintendence of the Rev. James Gerald Joyce, rector of Stratfieldsaye, a course of excavations was commenced by order of the Duke of Wellington, which has been continued ever since with more or less activity, and has led to discoveries of very great importance in determining the direction of the streets and the general plan of the city, as well as the character of the several buildings which have been laid bare, including those of the Forum. Without attempting to follow the order or history of these excavations, we shall be content to describe the present condition of the site of the ancient Calvea—the modern Silchester—and a few of the most remarkable of the buildings which have been discovered.

It would be difficult to imagine a more lonely or desolate locality than the spot on which this once populous city stood. It is traversed, it is true, by the main Stratfieldsaye highway, which intersects in the direction of west-north-west the area inclosed by the walls; but with the exception of a solitary farm-house, two or three labourers' cottages, and a deserted-looking church, it presents no sign of life or activity. Calvea Atrebatum lay on the Great Western Road, between London and Aquæ Solis or Bath. It covered an irregular heptagonal area of about a hundred and two acres, inclosed by a wall, the ruins of which are still on the average twelve or fourteen feet in height, and in some places considerably higher. The circuit of this wall is nearly two English miles. Outside of the wall on the north-east side are the remains of an amphitheatre, an elliptical inclosure of a hundred and fifty by a hundred and twenty feet. The city was entered by four gates—north, south, east, and west, and was traversed by two principal streets, following the north and south and the east and west lines, as was usual in Roman military stations, but dividing the whole area in this instance very unequally, owing to the irregular figure of the space inclosed by the wall. The streets intersect each other at right angles, but the eastern segment is very considerably larger than the western. The modern highway does not coincide with either of the ancient streets; and this also divides the inclosure unequally, there being about two-thirds of the inclosed space on the southern side of the modern road.

The conductor of the late explorations, in selecting the particular spot at which the operations commenced, was influenced less by an expectation of discovering objects of special interest in that particular spot than by the desire of establishing a point of departure from which to investigate the general ground-plan of the city, and thus pursuing his way step by step to the various places of real interest, from an antiquarian point of view. The spot was chosen chiefly because it had quite recently been ascertained, in turning up the soil, that buildings of some extent lay close to the surface. It adjoins the Stratfieldsaye Road, and lies about midway between the points at which that road intersects the walls of the city. Within

half an hour from the commencement of the excavation the ancient structure was reached, at a depth of hardly a foot from the surface, and proved to be the pavement of the central gallery or corridor of a small Roman house, situated at the angle at which two minor streets intersected each other. The house was of the most ordinary kind. The corridor, sixty feet long, extended from end to end, having five rooms at one side and two at the other; the northern and western walls abutted upon the two intersecting streets already mentioned; and on the south side was a small yard, with a long narrow shed, the roofing-slabs of which still remained on the spot where they had fallen to the ground, their supports having given way. The pavements throughout were of the plainest red tiles, with the exception of a small room, which is conjectured to have been the *lararium* or household shrine, and in which the floor was finished in colours and in mosaic of finer work. Another of the rooms was easily recognisable as the kitchen, and contained the fragments of a millstone and of various domestic vessels, among which was a portion of a broken water-jug carefully mended, the pieces being joined together with a leaden rivet—a curious evidence of the humble thrift of the occupants. All the surroundings of the house were of the same humble description, as was indeed the entire quarter in which it stood.

But the position and direction of this humble street served as a clue to the discovery of a more pretentious quarter—that traversed by the great north and south street which intersected the city. Here two of the houses have been excavated, both of a class far superior to that first laid open, but much less luxurious than the ordinary Roman villa with which Pompeii has made the world familiar. The more important of them faces the main street, and stands upon an area of ninety-eight feet six inches by a hundred and twenty-six feet. It consists of a quadrangle fifty-three feet six inches by forty-one feet seven inches, on one side of which were the entrance and three principal living-rooms; while the other sides were surrounded by a gallery, from which access was had to the remaining apartments. The quadrangle appears beyond all doubt to have been an open one; and yet no provision is apparent, although careful search has been made, for collecting the rain, as by the ordinary *impluvium*, or carrying it off by a drain below the foundations. Two of the principal rooms, each twenty feet by sixteen feet, were warmed by hypocausts, both heated from a single furnace, the hypocausts communicating with each other beneath the floor. There is nothing in the arrangements of these hypocausts differing substantially from those of ordinary Roman houses; but the space excavated, which has been preserved unaltered, is well worth careful study, as shewing very clearly the details of the ancient heating-apparatus. There can hardly be a doubt that the floors of the two apartments thus elaborately heated were of an unusually superior character; but it is curious that hardly a fragment of either floor now remains. It would seem as though both had been carefully taken up and carried away, at some time subsequent to the destruction of the city; and it is remarkable that almost all the little columns formed of tiles, which, in accordance with the usual principles of construction originally supported the

floor of the room on which stood the hypocaust furnace, have been in like manner carried away: out of upwards of eighty such columns only eight now remain. The foundations, too, of the outer wall of this chamber have been undermined, as if to make a way of entrance beneath the floor from the outside; and this for the purpose of more easily and securely taking up the pavement. Who the despoilers were it is impossible to guess.

Both these structures lie to the north of the Stratfieldsaye Road; but it is upon the south of that highway that the chief interest of the visitor must lie, as it is there that the great centre of commerce and law for the city is situated—the Forum of Silchester. In following through the cornfields the footpath which leads from the remains just described to the site of the Forum, the visitor comes unexpectedly upon the foundations of a circular or rather polygonal (sixteen-sided) temple, sixty feet in diameter. It is surrounded by an ambulatory; and the foundations of the inner as well as the outer walls are still visible; but no trace appears of the columns which are usually found in temples of this construction. Neither has any altar, statue, or inscription been discovered, nor any other indication of the god in whose honour it was erected, or the purpose to which it was dedicated. A few coins were turned up in the course of the excavation; a worn coin of Vespasian, and a perfectly fresh one of Septimius Severus, to which latter reign the date of its erection may with some probability be referred.

In a report of the visit of the Oxford Historical and Architectural Society to Silchester in 1873, the Forum, the chief object of interest, is described as 'occupying an area of three hundred and thirteen by two hundred and seventy-five feet, and nearly surrounded by an ambulatory or porticoed piazza.' The entrance was from the east, and the remains of a sewer were found beneath the ancient gateway. Shops were ranged on either side of the gateway and along the northern side of the courtyard towards the Basilica. 'In one of the shops a large number of oyster-shells were found; in another a number of hooks belonging to steel-yards, and suggesting the idea of a butcher's shop; in another the spurs of game-cocks, in some instances supplemented by steel spurs; in another, a small bar of silver, shewing a jeweller or money-changer. The Basilica was a noble building, with a well-defined apsidal end on the south, but that on the north appears to have been somewhat altered. The wall which supported the Tribunal on the south still exists; and the substructure of a row of tall and handsome columns, which had foliated caps approaching the Corinthian order, extends along the eastern side.' On the west there is a series of rooms, the specific purpose of which can but be a subject of conjecture; but there seems little doubt that they were all devoted to public use. In one was found a legionary eagle of bronze. The floor of this room was covered deeply with the remains of burnt wood, and was marked with black stripes, shewing the position of the beams. In another was found an imperial *bulka* or seal. One of the apartments, too, was distinguished from the rest by the superior style of its pavement, and is supposed to have been the council chamber. The only indications that might fix a date, are those found on the coins that have been disinterred, but which have

a broad range from the time of Caligula A.D. 37 to A.D. 410.

The height of the roof, as inferred from the other proportions of the building, is supposed to have been fifty feet. The interior was in all probability furnished with galleries, and although no trace appears of the foundation of a dividing wall, it is likely, from various indications, that a tribune existed at the north as well as at the south end of the basilica, so as to afford provision for two courts within the building. The work of excavation has been done so thoroughly that the ground-plan is at once intelligible even to an unprofessional visitor; and while, by an easy effort of imagination he recalls in fancy the scene, such as it may have been in the days of Roman mastery, he cannot but be vividly impressed with the energy and the magnificent conceptions of that extraordinary people, thus carrying to the remotest extremities of their insular dominion, not alone the municipal, civil, and military institutions of the mother-country, but embodying them in the same grand and imposing forms under which they flattered the national pride of the Roman beneath the shadow of the Capitol itself.

Inferior, of course, in the interest of detail, but nevertheless very imposing in themselves, are the remains of the walls and gateways of this singular relic of the past. We have already described their extent and general appearance. The wall, in addition to the security afforded by its great height, was surrounded by a fosse a hundred feet wide; and that its depth must have been very great is to be inferred from the fact that, notwithstanding the accumulated ruins with which it is choked, it is still fourteen or fifteen feet deep. The construction of the gateways too was peculiar. 'Instead of having circular towers projecting, to defend the entrance, the walls returned inwards with a circular sweep, and within the recess thus formed the gates were placed. Within the thickness of the walls at the east gate, guard-chambers, six feet by five feet, have been uncovered at either side.' The southern gateway, which stood upon the road to Winchester, must have been a very imposing structure as seen from the city side. It was 'flanked by two lofty columns with moulded caps and bases, supporting a pediment, beneath which the chariots and horsemen would pass, the road for the pedestrians being on either side.'

There were no traces of wheel-tracks, however, such as are found on the streets of Pompeii. And indeed, while from an historical point of view the remains of this curious city are full of interest, it is hardly necessary to say that, as throwing light upon the social condition of the time and upon the life and manners of the population, their value dwindles into insignificance when compared with what is revealed at Pompeii, or even at Herculaneum. At Silchester, the walls of the houses have disappeared, almost to the very foundation line. In this respect, partly owing to the nature of the soil, but chiefly to the inferior building material, the destruction, or rather the mouldering away, has been far greater here than at Uriconium, where several feet of the walls have in some instances been preserved. But even at Uriconium, and still less at Silchester, do we find anything like that world of grace and beauty which tells so wondrously, from the frescoed walls and inlaid floors of

Pompeii, the story of the everyday life of ancient Rome, and reveals so pleasingly the minutiae of its manners and institutions. And yet even Silchester, in the depths of its decay, is not without its own story. A few of the rougher and less perishable appliances of the mechanical arts or of domestic life at least have escaped destruction. We learn from occasional discoveries of implements or domestic utensils a little of the pursuits and habits of the old Silchesterians. We infer, from a still recognisable strigil, that they indulged even in those refinements of the luxurious bath, in which the pleasure-loving Romans delighted. The extent and capacity of the amphitheatre shew that these military colonists had not failed to carry unchanged to Britain the savage taste for those bloody exhibitions the indulgence of which had long made 'a Roman holiday' at home. The steel spurs found in the shop of the Forum prove that the people, like their countrymen in Italy, retained a taste for the 'captivating pursuit of cock-fighting'; and that money-getting and money-hoarding prevailed here as elsewhere, is clear from a curious strong-box discovered in a room of one of the mansions already described. 'It was sunk in the floor for safety, instead of being let into the wall, as we place them. A wooden framing or collar had been let into the pavement, and a wooden box constructed within it, having some pieces of flanged tiles beneath the bottom, to raise it above the damp. Three formidable iron hinges turning on loops, whose ends were spiked through the collar and clenched behind it, supported the lid. Those hinges stood one at the centre and one at each end, and had oak planks about an inch and a half thick bolted down upon them; the bolts remain projecting still, with portions of wood-fibre adhering.'

Much still remains to be explored at Silchester; but even as it is, the associations of the ancient site, assisted by a small and ill-assorted collection of minor objects found in the ruins from time to time, and roughly preserved in a museum extemporised on the spot, furnish abundant materials of instruction, or at least topics for intelligent speculation. Even those whose tastes will not tempt them to linger over the antiquities, will find quite enough of interest in the surrounding country. The merest holiday-maker can hardly fail to enjoy a day on the breezy slopes of Heekfield or Hazely-Heath, or among the pleasant shades of Stratfieldsaye, or the stately woods and ferny glades of time-honoured Brunshill.

THE ARAB WIFE.

A TALE OF THE POLYNESIAN SEAS.

CHAPTER IV.—I AM INITIATED.

ABOU soon after made his appearance, and the sun being about to set, I followed him, in the hope that there would be some meat; for strange as it may seem, the diet of rice, fish, dates, &c. never satisfied me, and I was longing for more solid food. Abou led the way right up the hill to the rough-looking castle I had noticed, where we soon entered a narrow portal secured by a massive door. This brought us into the courtyard, where were piles of date-bags, great dubbhas of ghee (a kind of prepared butter), barrels of biscuits, boxes of dried

fish, and on one side stabling and fodder. The courtyard was filled with Papuans and Seedis, who were eating their suppers with much enjoyment, chattering away like so many magpies. One or two Arabs were lounging about, who addressed a word now and again to Abou. Suddenly the sun set, and then followed an almost instantaneous darkening. Immediately a sentinel on one of the four small towers which stood at the angles of the walls shouted something in Arabic which I did not then comprehend, only I noticed that 'Allah' was repeated many times. Every Arab at once prostrated himself on the ground and repeated his prayers, the ceremony lasting about seven minutes. When it was over, we went into the building through another excessively narrow door, up a flight of steps, into a moderate-sized hall, where we formed parties of four, and squatted ourselves on the ground. Abou clapped his hands, and soon black Seedi servants appeared, bearing a huge platter of the eternal rice; another of some fish fried in ghee, and hissing hot; another of rice boiled in ghee, and coloured with saffron, to which raisins were added. Everything was of admirable quality and well cooked, the rice being as well boiled as I had ever seen it at our mess in India. The fish was excellent, and I disposed of it in excellent style, with my right hand making up the balls as if I had been all my life at it, and breaking pieces of fish with great dexterity. This seemed to please the Arabs greatly; and Abou, as a mark of special favour, made a ball of rice and popped it into my mouth, I swallowing it with the best grace imaginable. The pilaw with raisins was as good as anything I ever ate, and the servants brought us *alwa* to eat with it. This sweetmeat is an immense favourite in India, being imported from Muscat in Arabia; and as soon as I saw it, I cried 'Alwa!' to the great delight of my comrades. I described to Abou the fair at Bombay, which is held in the district of Byecolla, and how there were thousands of stands for the sale of this favourite sweetmeat. The Arabs listened gravely, and exclaimed: 'God is great!' with much unction, at its finish.

When dinner was over, the servants brought in silver ewers and basins beautifully chased, but dreadfully tarnished and dirty. Each in succession washed hands and face, drying them in the air. Then we went outside on the hill, the night being very fine, and sat in a circle, smoking from a date-wood pipe which passed round and round, every one taking a few whiffs. The Arabs managed to fill their cheeks completely, and then expelled the smoke in equal volumes from each side. This I could not manage, and my failure seemed to be a subject for grave mirth. The servants then handed round little cups of the finest porcelain, which were without doubt once the property of some pigtailed victim. These were filled with such coffee as I never before tasted. It was black, it was bitter; but it had a flavour and an aroma positively delicious. I shouted 'Moka!' and Abou patted me in a fatherly way on the cheek. Looking at me musingly for some time, he then spoke in Arabic to the others, who nodded their heads in assent and spoke, looking at me in a very friendly manner, as much as to say: 'Ah! we shall convert him yet.'

This I determined to resist; but I must confess

that I began to like the Arabs very well, for they were to each other and to me like brothers. And I liked the way of life well enough if there had been more meat and less fish. Further I must confess that I began to feel very much like joining them, though this I must own was aiding and abetting in piracy. It was a thing to be despised and hated and hunted down, and to be hanged at the yard-arm for. But it did not seem like piracy to me then; it seemed like being a jolly free-booter in the middle ages, living in a castle, and levying toll on the Chinese merchants. I was only seventeen, filled with romantic notions, and this life seemed so fascinating; and though I have since lamented this questionable morality on my part, the above reasons are at least honest.

The evening passed away. The beautiful stars, a thousand times brighter than they are in England, came out, and seemed to shed down radiance on us. The fragrance of myriad unknown flowers floated around us, and filled the air with its sweetness. The dinner, the pipe, and the coffee had made me perfectly at ease. In spite of my being a captive in a barbarous island and absent from my father, I was absolutely happy, and my senses seemed brimming with unknown joy. My eyes must have flashed and my face burned, for Abou noticed my excitement; and I told him how happy I felt, and how grateful I was to him and to the others for the kindness I had experienced.

'My son,' said Abou, 'happiness with us is not transient; we are always thus. The storms that lash the ocean never penetrate here; the typhoons that desolate the world are broken by our mountains. We are here secure from attack, both by the difficulty of penetrating through the long and narrow harbour, which is filled with quicksands, and the invincible bravery of our chief and his Arabs. There are no noxious insects on this island, nor snakes, nor harmful animals; but there are deer and game and abundance of birds, delicious to the palate. This is an earthly paradise. When tired of inaction we launch our prows, and we attack the enemy, as our forefathers have done, and we make their wealth our own. Then we return to our lovely isle, where our wives and children wait to give us a warm welcome. Believe it, young Giaour, there are no mortals so blessed as we.'

'I feel it! I know it!' I cried.

'Then make your petition to Nizam al Reis to join his tribe, and he will perhaps admit you. 'Tis true you are a prisoner, but you were taken by his sword, and you fought like a young falcon. He will admit you.'

Carried away with the idea, I agreed to make my petition to the chief in the morning; and with flushed pulse and excited brain I composed myself to rest among a mass of flowering shrubs of the most exquisite odour, soon finding the most absolute oblivion in the arms of Somnus.

Awaking early the next morning I found the sky already reddening, and as soon as the flaming disc of Sol shewed itself, again came the hoarse cry of the sentry calling to prayers. I looked around and saw my companions of the past night all deeply engaged in their devotions. In a few minutes I rejoined them, and proceeding to the court-yard we found a number of dusky slave-women milking numerous sleek-looking goats. In half an hour Abou brought me a basin of hot

milk and a dhourra cake (a thin-like biscuit), which I found very good. The basin by-the-bye was from the English Potteries. Then Abou took me by the hand and led me into the presence of the Reis, who was in a small room very handsomely furnished with carpets and sofas, and with a splendid damask curtain hiding a door at the other end. There were trophies of weapons, chiefly of swords and lances, on the walls; but in the centre was a suit of chain-mail, with skull-cap and steel gauntlets similar to those used by the Delhi cavalry.

The Reis was well dressed in eastern style, and his girile was a magnificent affair of heavy gold, richly chased and set with large turquoises. I made him a low bow, and he held out his hand, which I was about to shake; only Abou whispered to me to put my right hand under it and so raise it gently to my lips, which I did. Then my guide explained in Arabic that I was desirous of entering into his band and fighting beside him instead of against him. On hearing this, Nizam al Reis bowed his head gravely, and asked if I were willing to become a Mussulman; but being determined not to change my faith, I thought it best to temporise and say that I was unwilling to change my religion until I was satisfied that the Koran was better than the Bible. Being at present ignorant of Arabic, it was impossible to make a decision; but that I would diligently study, and when I had attained a clear understanding in the matter, I would let him know. This appeared to be satisfactory, and I retired in good order, Abou remaining with the chief. When he rejoined me he was in a state of high satisfaction, the Reis having made him a handsome present; and moreover, having given him orders to equip me in Arab style from his stores, with tulwar, lance, canjeer, and all things necessary for a full-blown Korcishi. He was also to instruct me in the use of my arms, and to perfect me in Arabic and in the full understanding of the Koran.

The next three months were accordingly spent in constant exercise and tuition. I soon picked up a sufficiency of Arabic to converse pretty fluently, and each day saw me improve. I learned to handle the lance and to fight in Arab style with the tulwar, which in actual warfare necessitates engaging an opponent's weapon, and using the canjeer with the left hand, avoiding his grasp by throwing the hand high up over his shoulder, and then stabbing close to the backbone, sending the blade right to the heart! I read the Koran diligently, constantly raising doubts, which good old Abou solved as he best could. From the Malays and Papuans I also learned to dive, and spent three weeks at the other end of the island, where there was a pearl-fishery which was worked by the slaves of Nizam al Reis. The divers, however, were freemen, who were paid good wages for their efforts. They could remain a long time under water, much longer than we could well believe in Europe. There was specially one man named Toma, who was a negro from Socotra, a huge fellow with an enormous chest, whom I have seen remain under water for two minutes and a half. The other divers called him the Fish, and he deserved the name. At my request he instructed me in the art of diving and of bringing up the pearl-oysters, and I accompanied him on many occasions, becoming quite an adept. At the end of the three months the Nizam sent for

me, and asked me if I was in earnest, and would fight fairly and squarely in his band. I replied: Yes; that I wished to be an Arab, to live like one, and to die, if need be, like one.

'It is well,' said he, appearing pleased and at the same time thoughtful, as if my words had suggested some train of ideas; but dismissing them, he added: 'I am going down into the village among the Malays; dress yourself in the rough clothes that Abou will give you; bring your Arab arms, and take this gun,' giving me a superb English rifle, that was evidently intended to carry either shot or ball. I obeyed his order implicitly; and with the gun on my shoulder, in a short time joined the Arabs, who, to the number of twenty-five, were accompanying the chief down the hill.

The council which took place did not interest me, because it was in Malay, and I understood but little of it. But it did not last very long; and at its conclusion I was told that next morning we should put to sea again, and that we were going to cruise in the Straits of Sunda. I received in charge the telescope, and was ordered by Nizam to keep a strict look-out, as the first discoverer had a better share than others in the looty.

CHAPTER V.—PIRACY.

Next day we started on our exciting if not exactly laudable occupation. Strange as it may appear, I did not feel a single qualm of conscience. My wound had completely healed, thanks to the care of my faithful friend Abou; and the very novelty of the life I was now leading seemed to lend an indescribable charm to everything around. I felt somehow as if impelled by a resistless current towards some unknown, but unfearful, fate. I was fulfilling a destiny.

I wended down to the proa with my traps and arms with as much eagerness as if I had been preparing for a picnic to Elephanta. There was a pleasant wind blowing from the south-west, and we bowled along at a fair rate without using our oars. We passed between Celebes and Borneo without any adventures, passing sampans and proas, who saluted us amicably, on the principle, I suppose, that dog does not eat dog. The wind, however, soon freshened disagreeably, and we were obliged to bring to under the lee of a group of islands that are uninhabited, and which are strangely enough marked in the chart as reefs.

The gale shortly abating, we left the shelter of these islands and spread our matting sails. I was more and more disgusted with the proas, which are incapable of resisting a heavy sea or a head wind, are easily sunk, not very fast, and hold a very small cargo. I represented this to Abou, who agreed with me that the proas were poor craft, and depicted in glowing terms the merits of the Arab dhows and buggalows, though for my part they seemed to be clumsy too. My father, who served in the Peninsular War, had gone on half-pay after Waterloo, and then received the permission of the government to join the Peruvian Republic in its struggle for independence. There he had seen the craft called a *piroga*, not the tiny canoe of that name, but a schooner-rigged craft, very light, very buoyant, yet with considerable storage-room. It seemed to me that we wanted something of the sort, and I began pondering on the possibilities of my making a great improvement in our marine,

whilst I diligently swept the horizon with my glass. There was quite as much wind as we could manage, and the vessels we sighted would have been too much for us, so I simply notified to the Reis that they were in sight, and he made no announcement to his men, deeming it unnecessary. The third day and the fourth day passed after we left the islands, and we were still beating about the strait, when luckily, towards evening the wind fell, and as the sun went down I caught a glimpse of three Chinese junks rocking to and fro. We made for them with exactly the same result as on a former occasion, only this time there happened to be on board a mandarin going to Cochin-China, in whose boxes we found strings of magnificent pearls and some costly furs. These last I begged for and obtained, as no one seemed to covet them. But they were so splendid that I took quite a fancy to them, and was willing to accept them as my reward for discovering the junks. Whilst we were busily transferring the valuables, an idea flashed over me, which I communicated to Abou. What if we took one of the junks and converted it into a proa? Abou said it was slower than the slowest we had. I admitted that, but forced him to own that we could never capture anything but junks when there was a wind, because the proas could not fight a European vessel at a distance. But if we were in a junk, we could feign to signal for assistance, and they would let us come alongside. Then we could pour our men on their decks, cut and hack the rigging, and have them in our power in a trice. Abou said that there were plenty of piratical junks, and no vessel would allow them to come within a quarter of a mile. Still, being under the impression that Europeans never suspected the existence of pirates in junks, I suggested that the matter might be referred to the Reis Nizam, which was accordingly done, and to my great content he sent for me and said: 'Son, do you know how to steer?'

'Yes,' I replied; 'the second-mate taught me, and he shewed me how to take the reckoning.'

'Then, if I send you with Abou in this junk, can you find your way to Gezireh?'

'Surely, Al Reis; there is no great difficulty.'

'Well, then, I am satisfied to send you with Abou, whom you must obey in all things; and I know that if I trust you, you will not disappoint me.'

I was greatly pleased, and replied that he should have no cause to think otherwise than well of me, and that I would obey Abou as if he were Nizam al Reis himself.

This satisfied him, and he turned to Abou, telling him to turn out all and sundry of the Celestials into the other junks and to stand no outcry. If they did not hurry up, he might tell the Malays to take their heads. This caution was not needed, for the pigtail, as soon as they were shoved in the direction of the other junks, seemed to comprehend the situation, and speedily transferred themselves. But one old fat Chinaman, who, I suppose, was the owner of the junk I was about to appropriate, made a pitiful lamentation, and on being jostled from the vessel made a rush to the other side, and threw himself in the water, his long pigtail floating for a moment on the top. Soon we had the junk to ourselves; and after ascertaining that we had plenty of provisions and water, and that the treacherous crew had not

scuttled the craft (of which act they were quite capable), we said adieu to our friends, and departed on a cruise of our own. The proas, not satisfied with the results of the day, still continued beating the Straits of Sunda, whilst we sailed boldly for the Straits of Malacca.

We had not a very large crew, having only fifteen Arabs besides ourselves and forty Malays. We had no Papuans, because they are not good fighters and are only fit to pull the oars. Our hope and expectation was to catch some Batavian from Java, and we revelled in anticipations of the surprise of the fat-headed Dutch. I had some lurking fear that we might meet a British vessel, but I resolved, if it should so turn out, to try and persuade Abou that it was a man-of-war, which it would be madness to attack. But I was not reduced to the necessity of any such pious deception, for two days after we hauled away from the proas, we were overtaken by a large vessel, evidently Dutch. She fired a gun at us, to our great surprise, and I thought that we were found out; but Abou informed me that the Dutch merchantmen invariably pillaged the junks that were alone, and even sometimes whole fleets. This news put me into an excellent humour, as I thought how the biter was going to get bit. Our men all crouched under the bulwarks, their eyeballs gleaming, and their weapons ready in their hands. The ship fired again at us, but we kept right on, and even hoisted a small triangular sail above the chief one. This was immediately responded to by another shot, which plumped athwart our bows. We immediately yawed, and approached our friend, who discontinued firing, and who, when we were within some five hundred yards, despatched a boat with an officer, to whom we threw a rope with due humility. The officer and the four sailors were at once secured almost before they touched our deck, and the junk gave another veer which brought her fairly alongside. No sooner had the vessel touched, than with a tremendous yell our fellows were upon the decks laying around them with desperate ferocity. I found myself opposed by an officer of middle age, who, being a poor swordsman, was quickly disarmed and made a prisoner. In less than five minutes all was over, and our prisoners, to the number of twenty-eight, were tied hard and fast. We had hardly made so good a haul as we expected; but I insisted that the prisoners should be released one by one and sent on board the junk, which should be given to them to go whosoever they chose.

Abou agreed, and his influence with the Malays carried the measure. Our loss from the surprise was small; we had only seven of our Malays killed, and four Arabs wounded; but the wounds were slight, and would be healed before we got to Gezireh; so that the *coup* was a success from that point of view. After transferring our belongings from the junk to the merchantman, we transported our Dutch friends, still bound hands and feet, to the former, and then released one, giving him a knife and permission to release the others after we were clear. Then with joyful hearts we turned the vessel's prow to Gezireh.

The Malays had never been in a square-rigged ship before; but luckily for me, most of the Arabs were good seamen, and able to steer; so things were comparatively comfortable and easy, and

Abou and I with light hearts commenced making a thorough investigation of our capture. But first he beat heavily upon the deck with a handspike, which was a sort of summons for the crew, and informed them that the cabins were tabooed, and must not be entered by any one, being reserved for the Reis. And to make things sure, he got a hammer and some big nails, and fairly nailed up the doors of the great cabins. The saloon we reserved for ourselves, and the berths around it for our own special use. These little arrangements being made, we descended to the hold, and found that the vessel was laden with palm-oil, seeds and spices, bales of black and red cloth, sugar and coffee. The Malays and Arabs were by this time busily engaged in examining the chests of the sailors in the fore-castle and the cabins of the petty officers amidships, where, it must be confessed, they found little to reward them, though in the carpenter's bunk there was an abundance of tools of fine steel, which were eagerly divided. The armament of the Dutchman was unusually heavy, consisting of carronades, and a long gun amidships on a traversing platform. Had the ship not been taken completely by surprise, a fleet of proas could never have taken her even in a calm; for the long gun carried a shot of about forty pounds-weight, which could have sunk a proa at a long distance; and being on a revolving platform, could have been fired in every direction, which would utterly daunt the Malays and Papuans.

I felt a desperate desire to practise a little, so as to teach the Arabs how to revolve the gun, point and discharge her; but our position was rather too ticklish for any such amusements. As the captain's cabins were fast closed, we could not know much about her, and if we were signalled by some other Dutchman, we should infallibly make some blunder, which would reveal our character. As it happened, we sighted several vessels, but did not come within hail of any one, making Gezireh without molestation or adventure. As we sped up the long and tortuous channel with a good wind blowing aft, we chuckled over the consternation which our appearance would cause, as no square-rigged vessel had ever been seen in that harbour. But we reckoned without our host, for Nizam and the proas had got in before us; and as soon as our top-masts appeared emerging from the channel, the harbour seemed alive with sampans, filled with screaming, shouting Malays and Papuans. Soon Nizam came in his great proa, and passed alongside, skimming up the ropes as nimbly as the most practised sailor. His eye lighted with pleasure as he glanced over the deck of the big vessel and noticed the carronades and the huge gun amidships. Running forward to salute him, he returned our salutation with evident approval. Abou told him in a few words of the manner of capture, the cargo, and the precautions we had taken to preserve inviolate the contents of the great cabin for him. He nodded, the Arabs being very reticent, and invited us to dine with him that evening, an honour which we gladly accepted. Then we adjourned into the saloon and had coffee, all squatting upon the carpet except Nizam, who took the place of honour on the sofa, Abou slipping away to see after the mooring of the vessel, which if her draught allowed it, Nizam

decided should be brought alongside the jetty and fastened fore and aft with big cables. The saloon was almost crowded with Arabs and Malays, all forming a huge circle around Al Reis on the sofa. I was commanded by him to take a place on the sofa beside him, cross-legged of course, and relate the incidents of the capture at full length, which I immediately did, to the great gratification of the Arabs, who looked upon the affair as being specially their own since I was an adopted son. Many were the ejaculations of approval and thankfulness which greeted me during the recital, and I really felt that it was the happiest moment I had ever known. After I had concluded, they began to discuss what was to be done with the cargo. Should it be divided, or should only a certain portion be divided, and the rest disposed of for silver in some Arab port. I said: 'O Nizam, I would advise you not to sell in an Arab port, but rather let us dispose of these goods in Goa, which belongs to the Portuguese; for they have so little commerce since the English have taken India, that they will not bother us with unnecessary forms, or oblige us to shew papers to the harbour-master; but we can bribe him with a bag of coffee, and all will be well'—

'But,' broke in an Arab in the circle, 'they will pay in gold, and we would rather have silver. If we take these things to Aden or to Muscat, we shall be paid in heavy silver reals. We do not wish gold.'

Nizam chimed in: 'I do not wish to impose my opinion as to what is to be done, though it is plain that here is ten times more coffee and sugar than we need after distributing to all that will use it, since the Papuans will not drink coffee, and the Malays very seldom. It is plain then that we must dispose of the greater part.'

Everybody here chimed in with a guttural hah, which means assent. The Arabic negative is la.

'Are you all agreed to distribute what we can, and sell the rest?'

Another chorus of hahs.

(Turning to me): 'My son, what else is there besides coffee and sugar?'

'There are bales of spices.'

'Well,' said Al Reis, 'will you distribute, or sell?'

'I advise, O Nizam,' said an old tough Arab who had often taught me the use of the tulwar, 'that everybody be free to take what he requires from a portion spread on the deck.'

'Taib, taib!' broke from all quarters.

'What else is there?' continued Nizam.

'There is palm-oil, and some dubbhas of ghee.'

'Much palm-oil?'

'Not very much, Nizam. It is in barrels. I think there are thirty-three or thirty-four.'

'What do you say, Abdallah?'

'I think, Nizam, there is too much to use, but not enough to sell. Let us distribute all but five barrels, and keep that for presents when we sell the other things.'

'Let it be so then. Is there anything else, my son?'

'There are hundreds of bales of black and red cloth, woollen cloth; and that I think is all. Then there are of course the provisions, including the *sur ka gosht* [hog's-flesh], which we don't eat.'

I put intentionally an emphasis on the *we*, and it was perfectly understood, for there was quite a

demonstration of hand-clapping; and as the Malays laughed heartily, and everybody was in good-humour, it was resolved that the dubbhas of ghee should be for the Arabs, only the pork should be for the Malays, and the Papuans should get a liberal share of palm-oil. In the midst of the general dialogue which ensued among the squatted group, Abou entered, and was at once invited to take up his position on the other side of Nizam, who, clapping his hands for silence, said that it would be best to give to each chief so many bales of red and black cloth, which he would distribute in quantities as suited himself. This was agreed to; and the conversation then fell upon what was to be done, now that we were so strong and had so many guns. Nizam was silent, and seemed to be plunged in thought, and soon after rose up and dismissed the crowd. By this time we were safely moored stem and stern at the jetty. At a sign from Al Reis to Abou and to myself to attend him, which we did, we went off gaily towards the Arab castle, Abou nudging me with his elbow to remark the chief's preoccupied air.

P A R R O T S.

THERE is no tribe of birds more interesting than that of parrots. The beauty, and often the splendour, of their plumage commands admiration; and they have still stronger claims to our regard in their intelligence, the readiness with which they are tamed, their affectionate yet strangely capricious dispositions, their display of passions resembling those of human beings, their monkey-like trickiness and mischievousness, their power of imitating the most various noises, and especially the power which some of them possess of learning to articulate words, to utter sentences, and even to repeat compositions of some length and to sing songs. Nor can any one fail to be amused with the eagerness they manifest to shew off their acquirements, their loquacity, and the opportune or inopportune appropriateness with which their speeches are sometimes delivered.

In the parrots, the foot is so admirably adapted for grasping, that it is freely used as a hand for a variety of purposes, and especially for taking hold of food and bringing it up to the mouth. The number of different species of this family is very great, and they are natives of almost all tropical and subtropical regions. In the Old World no species is found so far north as Europe; but in America there is one of which the geographical range extends even to the neighbourhood of the great lakes; and in the Southern Temperate Zone members of the parrot family occur in Tasmania and Tierra del Fuego. The species differ much in size; the Great Macaw of America being more than three feet long, tail included, and the Love-birds of Australia about the size of sparrows. Most of them dwell in forests, but a few are inhabitants of grassy plains. With a few exceptions they are gregarious, and are often seen in large flocks, which make a prodigious screaming. They often commit great ravages in fields and gardens. The British farmer, who complains of the damage done by rooks or pigeons, has no experience of winged plunderers at all to be compared with that of one whose fields of ripening grain are exposed to the visitations of

flocks of many hundreds of parakeets or cockatoos. It is not to be wondered, therefore, that settlers in countries where birds of this tribe abound, wage incessant war against them; and thus the Carolina parakeet has in a great measure disappeared from parts of North America where it was once plentiful, and the spectacle is no longer common of a stack on which a flock of these birds has alighted seeming, as Audubon says, as if a brilliantly coloured carpet had been spread over it.

Of the multitudes in which birds of the parrot tribe sometimes congregate, some idea may be formed from the following animated description of an Eastern scene by Mr Layard: 'I have seen at Chilan such vast flights of parakeets coming to roost in the cocoa-nut trees which overhang the bazaar, that their noise drowned the babel of tongues bargaining for the evening provisions. Hearing of the swarms which resorted to this spot, I posted myself on a bridge some half-mile distant, and attempted to count the flocks which came from a single direction to the eastward. About four o'clock in the afternoon, straggling parties began to wend towards home, and in the course of half an hour the current fairly set in. But I soon found that I had no longer distinct flocks to count; it became one living screaming stream. Some flew high in the air till right above their homes, and dived abruptly downward with many evolutions till on a level with the trees; others kept along the ground and dashed close by my face with the rapidity of thought, their brilliant plumage shining with an exquisite lustre in the sun-light. I waited on the spot till the evening closed, when I could hear, though no longer distinguish the birds fighting for their perches; and on firing a shot they rose with a noise like "the rushing of a mighty wind," but soon settled again, and such a din commenced as I shall never forget; the shrill screams of the birds, the fluttering of their innumerable wings, and the rustling of the leaves of the palm-trees, were almost deafening, and I was glad at last to escape to the Government Rest House.'

The species of the parrot family are easily recognised as belonging to it; but the characters which distinguish one group of them from another are not always so clear and decided. There are groups, however, which are sufficiently well marked to have received distinct popular names. There is one group which may be regarded as that of the true parrots, for to them the name Parrot is more strictly appropriated; whilst others are known as Parakeets or Parroquets, Cockatoos, Macaws, Lories, and Love-birds. Of the true parrots, one of the best known species is the Gray Parrot, a native of Africa, which is very often brought to this country, and is excelled by none of the parrot kind in powers of imitation and speech, docility, affectionateness, and mischievousness. It is about the size of a small pigeon, of an ash-gray colour, with a short crimson tail. It has been known to attain the age of nearly a hundred years. Some of the parakeets are nearly equal in size to the gray parrot, but most of them are smaller. They generally have long tails. The Alexandrine Parakeet, or Ring Parakeet, which is green, with a red collar, was the first of the parrot tribe known to the Greeks and Romans, and was much prized by them. It possesses in a high degree the same qualities for which the gray parrot is esteemed. It

is said to have been first brought from India by some of the members of Alexander's expedition. Cockatoos are notable for the large size of the head and the great height of the bill. Some of them are very docile and tractable, but they do not often learn to speak many words. They are all natives of Asia and the Indian Archipelago. Some of them are among the largest of the parrot tribe. Macaws are also generally large and their plumage is splendid; they have long pointed wings and a very long tail. They are natives of tropical America. They do not readily learn to speak more than a few words. Lories and love-birds, which are mostly natives of Australia and the Eastern Archipelago, are valued chiefly for their beauty, liveliness, and gentleness.

The resemblance between parrots and monkeys in their dispositions and habits is very strong. Like monkeys, parrots display a remarkable degree of intelligence; and like that of monkeys, it is often devoted to the accomplishment of the tricks in which they delight. The brain in parrots is larger and more perfect than in any other kind of birds. Exaggerated ideas of the intelligence of parrots have, however, been entertained by some, who, misled by the amusing appositeness with which they often utter the sentences they have learned to speak, have too hastily concluded that they fully understand the meaning of what they say. The parrot, an account of which appeared in the *Journal* of October 31, 1874, was the best speaker we ever heard. But no well-authenticated instance is on record of one having ever shewn a capacity for rationally sustained conversation. There is indeed a well-known and often repeated story of a parrot in Brazil which excited much speculation two hundred years ago, and which Locke thought worthy of a place in the midst of a grave philosophical discussion in his *Essay on the Human Understanding*, which has been regarded as indicating something of this kind; but it is not more wonderful than many other trustworthy anecdotes of parrots, which may easily be explained by supposing these birds to possess—as they certainly do possess, in common with many other animals—memory and association of ideas, so that words addressed to them and the tone in which these words are spoken recall the acquired sentence that seems their appropriate reply; or the utterance of an acquired sentence is suggested by the presence of some person, or by some circumstance that occurs. Locke quotes the story from Sir William Temple's *Memoirs of what passed in Christendom from 1672 to 1679*. Sir William Temple says: 'I had a mind to know from Prince Maurice's own mouth the account of a common but much credited story that I had heard so often from many others of an old parrot he had in Brazil, during his government there, that spoke and asked and answered questions like a reasonable creature; so that those of his train there generally concluded it to be witchery or possession.' He accordingly asked Prince Maurice about the matter, who told him that having heard of the parrot, he sent for it; and that when it was brought into the room where he was, with a great many Dutchmen about him, it presently exclaimed: 'What a company of white men are here!' They asked what it thought that man was, pointing to the Prince. The parrot answered: 'Some general or other.' When they brought it

close to him, he asked it: 'Whence come you?' It answered: 'From Marianan.' The Prince then said: 'To whom do you belong?' The parrot replied: 'To a Portuguese.' The Prince asked: 'What do you do there?' The parrot said: 'I look after the chickens.' The Prince laughed, and said: 'You look after the chickens?' The parrot replied: 'Yes; and I know well enough how to do it;' and began to cluck like a hen calling chickens. This parrot appears only to have been a well-trained bird, accustomed to say certain things, and ready to say them, but then only, on occasions such as arose from the presence of the Prince and his attendants and the questions addressed to it.

How far parrots are from being capable of acquiring the use of language, or anything more than the mere power of articulating words, clearly appears from the unquestionable fact that they never originate a sentence for themselves, but utter only sentences or broken sentences, which they have heard and acquired. They do, however, seem sometimes to use these sentences with a view to some purpose, as to call for some person whose company they desire, to ask for food, and the like; but this gives proof of no greater intelligence than a dog exhibits in obeying the commands of his master, or in petitioning after his own fashion for one thing or other, as all dogs do. Indeed, we may fairly suppose that if dogs possessed the same power of articulation as parrots, they would use it even to better purpose.

This paper may be appropriately concluded with a few anecdotes of parrots, some old and some new, illustrative of what has been said concerning them. The powers of memory which parrots possess are strikingly exemplified in one of the oldest stories of this kind on record, of a parrot at Rome about the end of the fifteenth century which could recite accurately the whole of the Apostles' Creed, and which was purchased by a cardinal for the enormous price of fifteen hundred golden crowns.

The death of a parrot was thus announced in the *General Evening Post* for the 9th of October 1802: 'A few days ago died in Half-moon Street, Piccadilly, the celebrated parrot of Colonel O'Kelly. This singular bird sang a number of songs in perfect time and tune. She could express her wants articulately, and give her orders in a manner nearly approaching to rationality. Her age was not known; it was, however, more than thirty years, for previously to that period, Colonel O'Kelly bought her at Bristol for a hundred guineas. The colonel was repeatedly offered five hundred guineas a year for the bird by persons who wished to make a public exhibition of her; but this, out of tenderness for his favourite, he constantly refused.' This parrot, we are told, 'beat time with all the appearance of science; and so accurate was its judgment, that if by chance it mistook a note, it would revert to the bar where the mistake was made, correct itself, and still beating regular time, go through the whole with wonderful exactness.'

In Willughby's translation of *Clunius his Discourse and Account of Parrots* we read as follows: 'The noble Philip Mariniux of St Aldegonde had a parrot whom I have oft heard laugh like a man, when he was by the bystanders bidden so to do in the French tongue, in these words: "*Illec, perroquet, riez*" [Laugh, parrot, laugh]; yea, which was more wonderful, it would presently add in the French

tongue, as if it had been endued with reason, but doubtless so taught: "*O le grand sot qui me fait rire!*" [O what a fool to make me laugh!], and was wont to repeat these words twice or thrice.' This has sometimes been adduced as a proof of the great intelligence of parrots. It is evidently, however, rather an illustration of memory and association of ideas, which, along with other things, will be found illustrated also in the following account communicated to us of a parrot in London.

A blue macaw in Brook's menagerie imitated to perfection the snarling, barking, and howling of dogs, and the cackling and crowing of fowls, and would also astonish the visitors by its readiness in mimicking any peculiar voice in the company. Dr Thornton bought the bird for fifteen guineas; but it moped, sickened, and seemed to have lost all imitative power till it was released from captivity and allowed the range of the house. Then it speedily recovered health and regained the beauty of its plumage, made itself perfectly at home, became very loquacious, and played many amusing tricks. Its sense of smelling was very acute, and it was generally the first to announce that dinner was ready. Its mode of shewing gratitude or satisfaction was by half expanding its wings with a gentle tremulous flutter of the feathers, and uttering a low and not unpleasant note. If food was proffered which its instinct or caprice rejected, it would take it with its foot and throw it down with an exclamation which sounded like '*There!*' Food that was to its liking was carefully examined, tasted, and then conveyed to the bird's own tin dish, in which it was packed close by pressure with the bill. If any of the children fell or was hurt, Poll was the first to give the alarm, and did not cease clamouring till the cause was attended to. Dr Thornton's son taught this parrot to descend from its perch at word of command and to stand upon his finger; then, on another order, it turned back downward, and hung on the finger by one foot, retaining its hold although swung about ever so violently. Like many other parrots and cockatoos, it was evidently vain and very susceptible of flattery; and was generally prompt in complying, if asked, to extend its wings and shew their beauty. It would walk on the ground backward, if ordered to do so, walking in this direction with the utmost ease. It was extremely fond of music; and with movements of the feet along the perch, danced to all lively tunes, its wings also moving, and its head moving backward and forward in correct time. By a peculiar working of the serratures or file which all parrots have in the upper mandible, against the lower, it diligently strove to imitate the noise made by a scissors-grinder who weekly visited the street; but finding that this alone did not quite serve the purpose, it had recourse to the expedient of striking its claws against its tin-covered perch, and accurately observing the time of the turning of the wheel, effected so exact an imitation once or twice a day, that the neighbours said the man had become a perpetual nuisance.

From the same source with the foregoing we derive the following account of another parrot. A lady had a gray parrot of four years old, that learned new words and sentences every day, and made surprisingly correct application of them. Enjoying perfect freedom, he would sometimes indulge in the expensive luxury of mischief, upon

which his mistress would scold him, when he would indignantly reply: 'Not a naughty Poll,' 'Not a bold bad bird;' and reiterate, with stamping of his right foot and an up-and-down movement of his body: 'I am not—I am not!' When she praised him, he would tell her that she was a darling and that he loved her. He was very jealous of attentions paid to children, and when he saw them carressed would cry: 'Go away, bold girl!' or 'Go away, bold boy!' using the terms girl and boy with accurate discrimination. He remembered every name that he heard, and applied it correctly to the person. Once seeing a visitor without a dog he was accustomed to have with him, he called the dog by name and whistled for him, although neither the gentleman nor his dog had been at the house for some months. He would mimic a visitor's taking off coat or shawl, as if trying to divest himself of his wings, and no one laughed more heartily at his performances than he did himself. He would play with the cats till tired of them, and then whistle for the dogs to chase them away. He was often allowed to be out of doors, and the crows would fly away in alarm from a tree when he got upon it, he calling *Good mornings* after them with great apparent delight.

'Let me catch you doing that again!' called out a parrot to some boys who had given a run-away ring to the door-bell of a house at Acton. One of the boys seeing no one but the bird in the cage, and struck with a feeling of awe, called next day and apologised to the owner of the house. As he was quitting the hall, Poll exclaimed: 'O then, you won't do that again.'

Want of space compels us to refrain from adding to the number of these anecdotes; but interesting anecdotes of parrots might easily be multiplied so as to fill a volume.

LEFT IN CHARGE.

IN TWO CHAPTERS.—CHAPTER I.

I AM a nervous man: there is no disgrace in that; and there's no denying the fact, which I honestly admit. I am a *very* nervous man. I don't think I am a coward; at least this confession might prove there is no moral cowardice about me, and after all, that is the right sort of courage in the long-run. However, no moral influence strengthened those nerves of mine, which caused me more suffering than any one suspected.

Not even my wife guessed the extent of my nervousness, or I am sure she would have been the last to leave me in charge under circumstances which, to say the least of them, were trying. For our house was situated in a lonely part of the country. We had no near neighbours, and reports had recently reached our ears of a series of strange and mysterious robberies committed by evidently accomplished thieves, judging from the way they laughed at locksmiths, penetrated into carefully barred-up mansions; and the deft manner in which the hasps of innumerable plate-chests were removed, the contents abstracted, and no trace left to guide the baffled police by which to lay hold of the perpetrators.

It may therefore be imagined how pleasant it was for me when my wife and daughters announced their intention of accepting an invitation up to London, 'in which I was not included fortunately,

as they all exclaimed in a breath, 'because some one *must* be left in charge.'

None of our domestics were family retainers—in fact, they were comparatively new-comers—hence the necessity for some one remaining at home; and as I dared not adduce my nerves as a reason for my restiveness under the arrangement, the matter was settled very speedily, and preparations were forthwith commenced for their departure.

'Be sure you have the silver carried up to your room every night, John,' said my wife, when we were all seated at dinner the evening preceding their journey.

'O yes,' exclaimed my eldest daughter. 'Don't forget, papa, or it may all be swept off, like the Merediths' was last week. Just fancy if we lost all our nice solid silver; why, it's worth ever so much!'

'Not so very much,' I answered carelessly, having observed as I fancied the black eyes of our parlour-maid fixed upon my daughter with rather a sharp expression; and remembering that she was a very recent arrival, I thought it advisable for once to detract from the value of the one possession of which I was extremely proud—my silver.

'Not so very much, John!' heedlessly exclaimed my wife; 'that good old-fashioned solid silver not worth so very much! Just feel the weight of one spoon.'

'Well, we haven't enough to make it worth any one's while to break into this house,' I said, with a poor assumption of indifference on the subject.

'O John!' and 'O papa!' resounded on all sides, which was followed up by my wife adding, as if to improve matters: 'I should not like my mother's pearls to go, nor should I enjoy hearing that my jewel-case was gone. You must keep that under the bed, John.' The black-eyed parlour-maid giggled audibly at this; at least I heard her. However, her duties compelling her to leave the room for a few minutes, I took advantage of her absence to rebuke my belongings for their extreme thoughtlessness in having spoken so incautiously before her.

'It is actually putting temptation in her way. How do you know she is not in league with the very gang themselves?' I wound up reproachfully.

It was silly, my wife admitted. 'Girls, don't do it again. But it will be all right this time, John. We needn't be afraid, because if any one came, you would be the first to hear them; and if Mary had told them anything, yours would be the room they would first come to.'

That was evidently a comfort to my wife, though I could not see much cause for congratulation. However, I had one staunch ally to assist me in guarding the house, and that was my dog Rover, a noble retriever, which I kept comfortably located in a kennel placed in the stable-yard. Gentle as a lamb with all of us, he had shown rather a lion-like disposition to strangers on more occasions than one; so I felt pretty certain if any attempt were made upon our abode, a very warm reception would be accorded to the invaders if Rover got within reach of them. To make quite certain of his co-operation in the event of an attack, I resolved to depart from my usual custom of chaining him up at night; and desiring a mat to be laid for him on the lobby outside of my bedroom door, I retired to rest for a few nights after the departure of my family, feeling pretty confident that on the

faintest indication of midnight marauders, Rover would be on the alert, and hearing his ominous bark, it would be a very brave man who set his foot within the hall. Besides which I kept a six-barrelled breech-loading revolver loaded; and also possessed a very deadly-looking cutlass, which, if everything else failed, I could fall back upon.

In accordance with my wife's desire, I had the most valuable plate carried up-stairs, and deposited, not in our room actually, but in my dressing-room which adjoined, where I considered it would be quite as safe. The jewel-case simply remained where it usually was, on a chest of drawers close by the bed under which she had charged me to be sure to place it.

My precautions were of course quite patent to the servants, who no doubt indulged in considerable merriment at my expense down-stairs, and probably pronounced them highly absurd; but one morning I was startled to hear that a house about five miles off, belonging to a Sir Clifford Ramsford, had been broken into and everything of value carried off; worse still, that the butler, who had been awakened by the noise, had received such injuries from the burglars that he was not expected to live. As usual they had escaped, leaving not a trace behind them by which to guide the bewildered and mystified police. I sat for a long time over my breakfast, ruminating on what my mode of procedure should be in the event of being attacked; and at last a bright idea struck me, which I resolved to put into execution; but what it was I need not say until I relate how it succeeded. I had a presentiment that my turn was coming, and it behoved me to have recourse to my stratagem without loss of time.

Accordingly, I carried it into effect; at least I made my preparations that very morning; and in the afternoon I rode into the town, a distance of several miles, where I made further inquiries at the police station as regarded the recent robbery, but only heard that the thieves were still at large; and from the quantity of things taken from Sir Gifford's, it was concluded the gang consisted of at least four or five men. Nothing could have been more cheering news for me, of course. Honestly, my heart sank somewhere into the region of my boots as I turned my horse's head homewards and cogitated upon the pleasant prospect which I felt certain was before me. The afternoon shadows were deepening by the time I got back; and as I rode slowly up to the side-entrance which led to the stables, I was somewhat surprised to see a shabby looking carriage standing at the front door.

My first impulse was to quicken my horse's movements, and get as rapidly out of sight as possible, believing I should thereby escape the necessity of receiving visitors in my wife's absence; but the next instant I was compelled to change my tactics as I perceived my presence had been observed by a gentleman who appeared at the door, and descending the steps, walked towards me without any hesitation. He was a tall fine-looking man of about forty, dressed plainly but well, in dark trousers, a frock-coat, and high hat which he raised slightly as he approached me.

'I must introduce myself, Mr Redmond,' he said in a tone so easy and well-bred, that nearer inspection at once satisfied me that he was what my first glance had assured me, a thorough gentleman. 'My name is Gordon; and happening to be

passing through Lowton' (the town from which I had just come), 'I inquired how far off your place was, and made up my mind it was too good an opportunity to lose of making your acquaintance, as I am such a very great friend of your brother Arthur—in fact we have been chums ever since he went out to India.'

'Gordon.' For a moment I paused, but only for a moment; the next I remembered frequent mentions in my brother's letters of a certain Tom Gordon, who, from his account of him, was one of the best fellows possible, besides having helped him materially in making his way in that distant land; and as Arthur was a very favourite brother of mine, it behoved me naturally to shew my affection for him by great cordiality to his friend. In one of the last letters I had received, he mentioned the fact of Mr Gordon having returned to England, enumerated his numerous kindnesses to him, and asked me if I came across him to shew him all the kindness I could.

So the ceremony of introduction did not occupy long. I welcomed him most heartily, and was thoroughly glad to find he had counted upon my doing so, and had brought his portmanteau with him, quite prepared to accept what he felt sure would be offered—an invitation to remain for as long as he felt inclined.

It was a perfect godsend to me this timely arrival; though I did not put my feelings into so many words, still I am sure he must have been more than satisfied with his reception. He accompanied me to the stable where I left my horse, to be afterwards cared for by a rather unrepresentable rustic who resided in sufficient proximity to our abode to permit of his services being put into occasional requisition. Fortunately for Arthur's credit, this adjunct to our modest establishment was out of sight when we paid our visit, as his exterior would have given rather a shock to Mr Gordon's sensibilities. However, to proceed. We were just returning to the house, when, on passing Rover's kennel, in place of the usually demonstrative, unmistakably glad welcome he accorded me, he shewed an amount of irritation and fierceness anything but encouraging to Mr Gordon, who stood at a safe distance whilst I stopped to quiet and soothe the excited animal.

'Be quiet, Rover, good dog; lie down, sir; kennel up.' But Rover treated me with perfect indifference, contenting himself with violent plunges towards my visitor, whose safety evidently lay only in the strength of Rover's chain.

'Is he savage?' asked Mr Gordon.

'Not in the least,' I replied; 'with us, at all events. I daresay he could be to strangers; he keeps intruders at a distance if he is unchained.'

'Do you ever unchain him?' he asked. 'I have such a strange horror of dogs that I hope you won't let him loose whilst I am here. They say every one has some pet aversion; dogs are mine.'

'How extraordinary!' I answered. 'I thought every one liked dogs. I am particularly fond of them.'

'Perhaps I ought not to confess my dislike,' responded Mr Gordon, smiling; 'but it is the truth; I don't like dogs, and dogs don't like me.'

I could fancy the latter part of his sentence was perfectly true. Gentlemanly and nice as Arthur's friend seemed, there was a thinness about the lips and a peculiar coldness in his eyes that enabled me

to imagine it was possible his dislike might beget dislike in animals so wondrously gifted with instinct as those four-footed friends. But the thought was a passing one. We moved on to the house; and after dismissing his cab, Mr Gordon and I entered the library, which, though dignified on account of its book-shelves, I suppose, with that name, was a small room adjoining the grander but far less comfortable drawing-room.

Mr Gordon presently informed me that he could only remain for two or three days at the utmost, as he was obliged to be in London on some very important business by the end of the week. He was home on very short leave from India, consequently was obliged to curtail all his visits into very limited periods; but he knew Arthur would be so glad to know that he had seen me, and if I had anything I wanted sent out to him, he would be so glad to take charge of it.

I had nothing particular to send, but I was truly glad to hear of my brother, and after dinner we sat talking of him for a long time. Mr Gordon was a most agreeable companion, so well informed and conversable that the time slipped by most pleasantly, and it was quite late when it first occurred to me to propose retiring to bed. It was only then that I thought of telling him of the chances that our rest might be disagreeably disturbed; but once having got upon the subject, I unburdened myself pretty freely. That my house would escape I confessed I felt more than doubtful; and I detailed, with one exception, my various modes of defence, the revolver, the cutlass, and last not least—Rover.

'Pray, let me be Rover's substitute for to-night,' said Mr Gordon. 'I am a particularly light sleeper, and I don't think a mouse could stir without waking me. Why don't you send away your valuables?' he continued. 'You should have them deposited in the bank at Lowton.'

'It certainly would not be a bad plan,' I agreed; 'at present it would be rather a blow to be robbed.'

'I should think so,' replied Mr Gordon. 'But do you mean to say you would shoot a man in cold blood if you saw him in your house?'

'Undoubtedly,' I replied.

'Or run him through the body with your cutlass?' laughed my companion.

'Or run him through the body with my cutlass,' I answered, with an immense tone of unhesitating valour and courage—'just as coolly as I could take my breakfast.'

'You are a brave man,' observed Mr Gordon. 'I would rather be robbed than commit murder.'

'Would you?' I responded, my courage rising with this unwonted accusation of bravery. 'I wouldn't.' I felt an arrant impostor as I spoke, as I knew well enough in my heart that my sentiments had been most falsely expounded, and that I fully indorsed the opinion he had expressed in preferring to be royally robbed rather than imbue my hands with the blood of a fellow-creature; however, the weapons gave me a feeling of security, though I had often wondered, if it came to the scratch, what use I could possibly make of them.

'I should be inclined to trust to a good thick stick,' he replied; 'you may rely upon my co-operation as far as that goes.—By the bye,' he continued, 'I am not sure that I ever saw a cutlass. It has a piratical sound about it; I should like to have a look at it.'

Of course I gladly acceded to his request; and another hour or more was spent in my dressing-room examining the weapons and talking over various matters concerning them. The cutlass, a long keen-bladed steel, was handled very carefully by Mr Gordon, and the revolver also came in for a very searching inspection.

'You are a bold man,' he said, as he replaced it in its case, 'to keep loaded firearms in your house: it has often led to serious accidents.'

'To tell you the truth,' I said, 'these are the last cartridges I possess. I have ordered some more, but they haven't come yet.'

'And for safety's sake, you keep those you have ready for immediate use. Well, don't present at me, I beg, in the hurry of the moment, if we should be attacked,' responded my visitor in a jocular sort of manner. 'I shouldn't like to have it within six paces in your hands. I am beginning to think you are rather a sanguinary individual. I fancy you are the terror of the neighbourhood.'

This ridiculous assertion rather tickled my vanity: the sensation was so perfectly new to me, and was so pleasant, that though I uttered a faint dissent, I felt sure I left him under the impression that I was a regular ruffian by reputation.

At last we parted for the night; but before doing so, I confided the cutlass to my friend, retaining the pistol myself, so that in the event of anything occurring, we were both fully prepared.

However, nothing happened to disturb us. We met at breakfast, and mutually laughed over my unnecessary precautions.

INDIA DURING THE MONSOON.

THE breaking of the monsoon (as the commencement of the rainy season in India is termed) is such a wonder in nature, that we propose giving an account of what was experienced at Kurruckee in the year 1874. On the occasion in question, the temperature had for many days been most oppressive, unrelieved even by the comparatively cool sea-breeze which usually blew for an hour or two in the forenoon, but which during this period brought no coolness with it; whilst the nights were rendered almost unbearable by a land-breeze which, originating in the hot sandy plains of Sindh, blew over the station with stifling warmth.

If the reader will recall his sensations during some of the warmest days of the past summer, he may obtain an approximate idea of the climate of the hot stations of India by remembering that the highest reading of the thermometer at mid-day in the shade *here*, would be hailed as a delicious midnight temperature *there*, during the hot season.

Day after day and night after night, the condition of the atmosphere was so oppressive as to lead to a feverish anxiety for a change of temperature. Two or three cases of heat-apoplexy which occurred during this period did not tend to elevate our spirits; and old residents gravely shook their heads as they foretold the early approach of the monsoons, and prognosticated an unusual rainfall, to be certainly followed by a season of epidemic sickness. At sunset every evening huge masses of clouds were piled up in the west, as if the welcome down-pour were at hand; but the following morning a cloudless sky and a sun of undiminished power brought disappointment to the scores of perspiring mortals,

who saw before them yet another day of suffering. The residents, of course, adopted such means as they fancied or could command, to counteract the effects of the unusual heat, the majority having recourse to mats made of a kind of grass root—which when damp emitted a faint scent—suspended over the open doorways, and kept constantly moist with water, the evaporation of which to some extent cooled the air in its passage through the mat, and rendered it less dry. Behind these mats the inhabitants sat or lounged, arrayed in the thinnest of garments, to obtain such benefit as they might from the cooled air.

For our part we obtained some relief by opening every window and door of the house at daybreak, and fastening them up as closely as possible an hour or two afterwards, which had the effect of shutting out some portion of the intense mid-day heat. At night the place was again opened, and we slept upon a charpoy or native couch, placed between two doorways, in the often unfulfilled hope that perchance a current of air might be set up for our benefit. Sound sleep, even had the temperature permitted it, was impossible for many minutes together, owing to the irritation caused by *prickly-heat*, a complaint we can only describe as an itching sensation over the whole body, and for which I believe there is no remedy except time and patience.

However, the days passed by, matters apparently growing worse; until at length, between one and two o'clock one morning, while trying to obtain some repose, I was aroused to full consciousness by the sighing of the wind in the far distance. Rising, I went to the door facing the west, and beheld a sight which impressed itself forcibly upon my memory. Overhead, the moon and stars shone with a splendour only seen in tropical and sub-tropical regions. Not a cloud obscured their beauty. All around, objects were as plainly visible as in the light of day, whilst over all there reigned that proverbial calm and strange hush which precedes a storm. Away on the western horizon was rapidly rising towards the zenith an intensely black mass, *within* which lurid lightning was incessantly flashing; at times dazzling the eye with a broad sheet of flame, and anon forming checkered patterns of fire. As the moments passed, the sighing of the wind increased to a roar, and the mass of clouds assumed the appearance of an immense solid body, forming a dark background against which the moonlit trees and sand-hills shewed in bold relief. The vivid play of the lightning continued, but the roll of the thunder could not be distinguished in the general roar of the storm. Whilst the mass advanced it seemed to envelop in utter darkness the objects over which it passed, as effectually obscuring them as if a pall had been suddenly suspended before them. While the storm continued to approach, all immediately around me was hushed and calm. Not a breath stirred, not a leaf moved. Not a cloud the size of a man's hand obscured the brilliancy of the firmament in advance of the intense darkness within which the storm was raging, and which was momentarily enveloping objects nearer and nearer. But in a very few minutes a strong blast of sultry air heralded the advent of the hurricane, which, before I could rush into the house and secure the door, was upon us, bearing with it a vast body of sand. In a moment we were in the midst of a

darkness rendered all the more intense by the vividness of almost incessant flashes of lightning, accompanied by deafening peals of thunder, which drowned all attempts at verbal communication with each other—the loudest shout being inaudible in the general uproar. I am no coward; but during the twenty minutes or so the storm was at its worst, I must confess to a very uncomfortable feeling of insecurity, as also to having had a very keen perception of the utter helplessness of man to protect himself against the weapons of Nature's armoury. Nor were the surroundings calculated to calm excited nerves. The terror of my wife was only exceeded by that of our cook and ayah, who crouched in a corner of the room with their heads enveloped in their clothing, and were trembling in every limb; it being a very curious trait of the native character that, though used to severe thunder-storms at the monsoon season, very many of them entertain an almost childish dread of the noise of the thunder, and invariably, if permitted, seek the protection of their master or mistress during such storms. Under the circumstances, I hailed with thankfulness the plashing of water on the roof, and noted a diminution in the roar of the storm and the blinding glare of the lightning. A deluge of rain succeeded; and the sand-storm having passed over, the thunder-peals were soon undistinguishable from the general noise, and all trace of the hurricane was now drowned in the pattering of the rain, which fell in such quantities, that what was so recently an expanse of sun-dried sand, gaping for moisture, was quickly converted into a watery swamp.

As the monsoon is not constant in its visits to Kurrachee, sometimes not a drop of rain falling for two or three years, particular preparations for its visit on that occasion had not, in many instances, been made; consequently, numerous were the complaints of roofs partially untiled, where the crows—whose mischievous habits your correspondent so graphically described in a late number—had broken or loosened the tiles, and the subsequent swamping of interiors.

For a month or more afterwards the rain fell at intervals, but was not accompanied with thunder or lightning. Towards the end of the first week the trees had lost their dingy, sunburnt appearance, and were clothed with lovely green foliage. The lately dazzling sandy plains were rendered verdant by the young grass blades, and the temperature had fallen to what, after the preceding heat, appeared to be cool and enjoyable; but between the showers the sun shone with undiminished force, drawing from the moist ground heavy vapours, rendering great care necessary to avoid sudden chills with their consequent fevers and dysentery.

In the Deccan, where the monsoon is an annual phenomenon, the heat, for the few days immediately preceding its breaking, is most oppressive; but as nobody who can by any possibility avoid it, remains on the plains during that season, it is seldom experienced by Europeans likely to write about India, and consequently is seldom mentioned.

Pleasant enough as a residence during nine months of the year, the Deccan in June, July, and August is a most uncomfortable place to live in. Then it is that the air is filled at intervals with fine sandy particles which, borne along by

gusts of wind, form the much-dreaded sand-storms. I have frequently watched the advance of one of these storms which, in the distance, appeared like a brownish cloud, before which dead leaves and loose rubbish of all kinds were swept with resistless violence. Its passage over the spot on which I stood would occupy perhaps one minute, perhaps ten; but long or short as the time might be, within that period everything within the house that afforded a lodgment for dust, would become thickly incrustated with it. So dense are some of these clouds of sand, they have a very perceptible influence on the light of the sun, sometimes obscuring it to such an extent as to produce a semi-darkness. Generally they were not preceded by any movement of the air, but held their course after the manner of a squall, and left behind them, so far as atmospheric disturbance was concerned, no trace of their passage. Whirlwinds would also frequently sweep over the place during this season; but these were not a source of much inconvenience, except when of unusual dimensions, or when a person chanced to be caught in the vortex of one, when his umbrella would run the risk of being twisted out of his hands and carried some distance away, and his skin ache with a peculiar sensation, caused by the whirling of sand and rubbish around him. I have heard stories of people being lifted off their feet by whirlwinds; but I never saw or felt one of sufficient power to produce that effect, though it is quite possible that such may have occurred in very unusual seasons.

When the monsoon does break, it is pretty much after the manner described above; but for the first three or four weeks, thunder-storms are frequent, and the downfall of rain more protracted and abundant, with very little diminution of temperature. Nevertheless, a great change takes place in the atmosphere, in so far as before the advent of the monsoon it was too dry, it then becomes too humid; and one's sensations for the first few days are those one might experience while passing through the drying-room of a large laundry. Every article of use or ornament is covered with a slimy condensation of vapour which, unless removed, is quickly converted into mildew; whilst, notwithstanding the heat, it is found necessary to keep charcoal fires alight in sitting and sleeping rooms to in some measure counteract the effects of the prevailing dampness. Then too, comes an increased plague of insects for which India is notorious. Winged ants in thousands flutter about the rooms, and ornament the furniture with their discarded members, unless every open door or window is protected by a blind of split bamboo; whilst fleas in tens of thousands enjoy their span of existence, to the great discomfort of the legitimate occupants of the house. Whence these latter insects come, and whither they go, was always a mystery to me. On one day not a member of this unpleasant family is visible; on the next their presence is but too patent, even to the most unobservant; and after a stay of some days they have gone as suddenly as they came! White ants, at all times a serious annoyance, appear to acquire fresh energy, and necessitate numerous precautions being taken against their ravages; whilst other ants, both black and red, become especially active. Frogs, of course, abound, the whole plain being more

or less covered with water; but these are not much of a nuisance, except when one happens to place a bare foot on the slimy jacket of a wandering member of the species whose fancy has led him to explore the mysteries of his—or her bedroom.

The mosquito, whose powers of annoyance can only be appreciated by its victims, literally swarms at this period; not, be it understood, in swarms of dozens together as gnats are seen in England, but more after the manner of common house-flies, each individual being quite independent in its motions. Another insect, which fortunately is not very abundant, also makes its appearance about this time. It does not sting or bite, and generally is harmless enough, fluttering about the light, or crawling over the book one is reading, until perchance, a stranger to its peculiarities may crush it with the hand, when it emits a most offensive stench, which is very difficult to remove. But as the monsoon progresses, the unusual vitality of the insect tribe diminishes, and gradually returns to its normal state.

I would here say a word or two as to the annoyances caused by insects, which are apt to be much exaggerated by some persons, perhaps because the aggressors are different from those to whose attacks they have been habituated in England; or perhaps the aggression proves more annoying to people whose nerves are irritated by excessive heat. Upon consideration, and after experience in both countries, I do not believe that, given the same condition of climate, Indian insects are much more troublesome than those of Great Britain. The common house-fly has at certain seasons as great a power as the mosquito of seriously affecting the temper of a drowsy man. Indeed, I think the fly even worse than the mosquito, and certainly quite as difficult to catch. Ants, moths, and even fleas are common enough in England, and though, as before stated, the climate makes a difference, they do sometimes annoy even the most phlegmatic Englishman; but being habituated to them, he accepts the annoyance as a matter of course, as does also the thoroughly acclimatised Anglo-Indian the attacks of his tormentors.*

Let it not, however, be assumed that the grumbling Anglo-Indian's grievance is an entirely frivolous one. In the worst months of the year his normal condition of temper can only be described as 'cross,' when the smallest trifles have a most irritating effect on the nerves. At such a time the discovery that the soles of a pair of boots, or the contents of a box of linen, carelessly left upon the floor for a few hours, have furnished a meal for a colony of white ants, is apt to interfere with that feeling of good-humour so necessary to real comfort. Nor when, wearied with the exhaustive heat of the day, one vain would sleep, does the occasional sharp 'sting' of the stray mosquito, which *will* remain within the curtains, act as a very powerful opiate. Other and such-like petty annoyances could be enumerated; but these will be sufficient, if the reader will kindly recall his own feelings of irritation when annoyed, as he must have been at some time or other, by some troublesome member

* We very seriously doubt if there be any insects in India more trying to the temper than the tiny midges which abound on the West coast of Scotland. So great indeed is their tormenting power that we have been repeatedly driven indoors before their attacks. The same remark applies to the 'deg,' the angler's pest.—ED. C. J.

of the English Insecta, and will also consider the dissimilar conditions of climate under which the irritation has been produced, to enable him to understand why so many Anglo-Indians should speak of the insects of their adopted country as a plague, and appear to exaggerate the troubles they cause.

From three weeks to a month after the commencement of the monsoon, the temperature begins gradually to decrease, and after some few days becomes really enjoyable. The usually intense glare of the sun is shaded by the masses of cloud which sweep over the sky, pouring down as they pass, the supplies of water upon which the inhabitants mainly depend both for food and drink. Vegetation assumes a rich tint of green, and luxuriates in a rank growth. Flowers commence to bloom, whilst between the showers the air is, so to speak, alive with gorgeous butterflies and moths. Day by day the climate more nearly approaches that of an ordinary English summer, the temperature at night falling so low as to render a blanket desirable, though never low enough to necessitate a fire. And, in the healthy vigour induced by the cooler climate, the inconveniences of the hot season are soon forgotten.

Sufficient has been said, we trust, to enable the reader to form some conception of the conditions under which many Englishmen are compelled—from inability to quit the plains for higher and more congenial districts—to exist during the hot season in India. There, however, as in England the amount of inconvenience suffered depends entirely upon a person's means, money being as powerful to ameliorate the disadvantages of excessive heat as of extreme cold. So far from wishing to detract from the advantages of the Indian climate, I have no hesitation in asserting, what, I feel confident, every Anglo-Indian will readily affirm, that, for the poorer classes, taking rank for rank, there is more true enjoyment to be got out of life in India than in England. That there is danger to some constitutions which no amount of care will obviate, no one will deny; but there is nought in it to actually shorten or render unbearable the life of a moderately careful European whose constitution has become acclimatised.

SICK-NURSING.

WE have been favoured with some observations on our article on 'Sick-nursing, an Employment for Educated Women,' which appeared in the number of this *Journal* of July 1. Miss Florence Lees wishes it to be understood that she was not 'the first student of the art of nursing who entered St Thomas's Hospital under the auspices of the Nightingale Fund.' She was preceded there by a lady who afterwards became a Sister of Charity; and we believe her admission was almost simultaneous with that of another lady who now holds a responsible position in the Edinburgh Infirmary. In 1861 Miss Lees made her application to the authorities at St Thomas's Hospital, and was accepted as a student, but her training was deferred, owing to her youth and other causes, until 1866. She is nevertheless termed by the Nightingale school authorities their 'first lady probationer.' This explanation may suffice on the score of Miss Lees' priority of studentship—a matter which scarcely affects the intention and spirit of our

article, which was to draw attention to the fact that sick-nursing is a suitable occupation for educated women, and that there do exist facilities for training any who are disposed to give themselves to this good work.

In writing of the nurses at present actively employed among the poor in London as coming chiefly from the superior 'domestic-servant class,' we referred to those who have for years been employed under the auspices of the East End London Nursing Society, and not, of course, to the ladies who are engaged with Miss Lees, and are at this moment training as 'lady probationers' at St Thomas's Hospital. It is thought to be of special importance that ladies by birth and education should take part in this work, and that they should feel well assured that their companions both in training and practice are of the same social position as themselves. The arrangements of the Nightingale training school are wisely made so as to meet the special circumstances of candidates for admission to St Thomas's Hospital for training. We have before us papers containing 'Regulations as to the Training of Hospital Nurses under the Nightingale Fund,' and also as to 'Special Probationers in the Practice of Hospital Nursing under the Nightingale Fund.' We suppose that it is to this latter class of pupils that the ladies belong who work with Miss Lees. Full particulars can, however, be readily obtained by any who desire to enter on either footing by application to the lady superintendent at St Thomas's Hospital, London.

In writing the article referred to in a late number of this *Journal*, we thought we had made it evident that our object was to direct the attention of all classes of women to a specially feminine occupation. Being deeply convinced that ministering to the sick and suffering of our fellow-creatures was peculiarly a woman's mission, and that skilled intelligent nursing alone can be effective, and in order to secure this there must be persistent conscientious training and teaching, we gladly endeavoured to direct the attention of such of our readers as were interested in the question to the possibilities of preparation that do already exist, and have produced results; nor do we hold ourselves responsible for every matter of detail necessary to be known by all candidates before they enter on a course of training, which can only be understood after consultation and inquiry at headquarters. All honour to noble and disinterested women who have given their lives to the service of their fellow-creatures, and who, in times both of war and peace, have bravely fought with disease and death, side by side with their medical brethren, and this, in very many cases, without fee or reward. It was, however, chiefly as to the art of sick-nursing becoming a *professional source of income* for educated women that we wished to write; and in order to suggest that when difficulties and objections might arise to the medical profession being adopted by our daughters who desired 'a staff to lean on in life,' there existed an opening leading to a remunerative, noble, and at present not overstocked calling, which might well be considered by those who were anxious to render themselves useful and independent.

PRICE 1½d.

IF.

Most of the greatest works of nature are done by the humblest instruments; and the history of individual man follows the same laws as that which builds mountains and raises continents. Very few sudden and isolated catastrophes come into one's life, all things being linked one with another, and as a rule, beginning with the simplest germ of a chance event. If. Life is a succession of ifs. The visit where we meet our 'fate;' the book by which we are inflamed with the ardent longing of youth for such and such a profession; the conversation whereby we are first led to consider the desirability of embarking in that concern which makes or breaks our fortune; the voyage where we are shipwrecked and lose our all or maybe our life; all these great events whereby we live in prosperity or die in distress come about as the sequence of that simple word If. If I had not gone; If I had not seen; then the whole course of my life would have been changed and the page of private history headed with my name would have been differently worded and differently illustrated.

For the marriages that are made as the natural result of neighbourhood, how many are due to this imp of chance, this intrusive and intermeddling little If? You, stationed in the far East, are invited to spend one of a choice of months at your uncle's, when you are at home for your two years' leave. You choose at hazard that which a girl from the far north has been invited to pass at her school-fellow's. You two meet, fall in love, and marry. But for that If—If you had not chosen this special month and had chosen any other you would never have met. The lines of your lives were traced on different planes altogether, and but for the chance of a coincident invitation the whole of your after-histories would have been arranged and transacted apart. She would not have married a man whose destinies lay in India; she would not have lost her health, been obliged to come home with her baby, have lingered a little while, pale and tremulous, at the

dear old manse, and then have gone to sleep with her child in the quiet churchyard for ever. If she had married Donald yonder, the young laird who had loved her from a boy, but who, good and brave as he was, had not known how to strike her fancy—but if—that fateful If!—she had married him and had lived as of old in the fresh free mountain air, she would have probably been the joyful mother of many children, and would have lived into old age. And had you married that fascinating little Creole whom you were 'spooning' before you went to Cromer, you would have had a wife who would have withstood the heat of Agra, and you too would have had a happy life. Instead of which she must needs go off with her handsome consul to the chill climate of Canada, where she was nipped like a hothouse plant set out on a winter's night, and fell into death through the cold as your poor mountain nymph fell into death through the heat. The lives that would have been born into the world had those two marriages been other than they were, make an appreciable sum of difference in current history; while who can count up all that would have been and would not have been, had things been arranged in an exactly contrary direction, and the woof and warp of this strange web of life been dyed of different colours and led through different 'cards.' If!—grim builder of tombs, silent architect of temples for the nations and of cottage homes for the lowly people alike; If—by whom the cradle is filled and the hearth left desolate and the great books of history are written, together with the little poems of private lovers and the faint dirges of unnoted sorrows—what misery might be prevented could we but see the face of the fate that hides behind that veil—could we but read the lines that follow on the preface!

If. If the Duke d'Alva had never been born? If Mary Stuart's boy-husband had not died, and Scotland had been ruled by a viceroy who understood the temper of the times and sympathised with the heart of the people? If Mary Tudor had borne a fine lusty boy who had united Henry's force

and Philip's tenacity, English courage and Spanish bigotry? If Madame Mère had died before she gave life to the babe whom she called Napoleon; or if he, *le petit* himself, running with uncertain feet about the rooms and corridors of that Corsican house had slipped on the stairs and broken his two-year-old neck at the bottom? If the son of Queen Hortense had married some rich soap-boiler's daughter in Tyburnia, and had renounced his dreams of ambition for the realities of good living—the potentiality of a throne for membership at White's and extensive dealings at Tattersall's? If Sir Robert Peel had not gone out riding that day? and if Cavour had had an English physician? Well.—If.—If.—if all these things had been or had not been the whole history of Europe would have been changed; and with this general history the life or death, the misery or well-being of countless individuals, and the still greater suppression or the yet more glorious recognition of the Truth by which men are made rich and glad. Even we Britons ourselves, less dependent than any nation in Europe on the life or doings of one man, even we would have modified much of our public action had the astute leader of the Liberals remained at the helm for a few years longer, going fair and softly on the way of reform, neither frightening the timid nor enraging the prejudiced, but knowing how to bide his time and when to hold his hand, as well as when to set all sail and make a bold push for the destined port. And though 'Italia Una' has done well, God bless her! and walked wisely on more than one difficult path, yet it is no ingratitude to those who have conducted her to say that, had her great master-spirit lived, she would have done even better than she has done. To recognise possibilities is not to shut one's eyes to the things which are actual and present; and to mourn for Cavour is not to despise his successors.

What odd chances come about by this If! If my friend E—— had not dined at a certain house one day she would not have heard a discussion about Paris and the Easter holidays, and she would not therefore have been taken over by her friends. If her friends had not chosen for their visit to Versailles the very day when she could not accompany them, she would not have had time or opportunity for paying a visit on her own account. In which case she would have heard nothing about the projected sojourn at Trouville for the summer. If she had not gone to Trouville she would not have seen her old school-fellow and favourite, so long lost sight of, designing to winter in Florence. If she had not gone to Florence she would not have taken pretty Beatrice, just out of school and *désœuvrée* for the next year. If Beatrice had not gone to Florence she would not have met with young Hardman from California, making the tour of the old world before returning to the new; hence she would not have married him; hence she would not have induced my friend E——, a lonely old maid who had grown to love her sweet charge like her own daughter, to go out with her and her kindly husband. And if E—— had not gone out she would not have visited the Yosemite Valley that day when the leaders bolted, the stage came to grief, and the poor dear was thrown to the ground, with concussion of the brain and the end of all things—of works and days and time and change for ever!

The whole chain was formed of a series of *Ifs*, any one of which wanting would have set all the rest awry, and would have woven life into quite another pattern of events. But who knows if a more beautiful pattern? For even to poor E——, who came to her end thereby, was not death the sweet god of rest and release rather than the ghastly King of Terrors?

The magnitude of the chances lying in what are apparently the most unimportant circumstances is one of the appalling considerations of life. It is as if we were beset by gigantic unknown forces which manipulate us according to their will; we all the while ignorant of their presence and powerless to prevent their action. No amount of caution secures us; and no defence by foresight, calculation, or distrust avails. The first link of all our future wealth or poverty, happiness or misery, is forged at nothing more important than a commonplace dinner or a five o'clock tea. Are we never to accept an invitation to dinner because of the unknown force waiting for us there? Is five o'clock tea to be to us like the Eleusinian mysteries to the uninitiated—a thing terrible and forbidden? If we were to let that fear of the hidden possibilities lying beneath unimportant action get possession of us, life would become impossible, and our only place then would be a monastery or a convent, with the heavy doors duly barred against freedom and the world, and the dim dull windows looking only into the safe cloisters of the confraternity.

If, Through the sighing of the sorrowful and the groanings of the oppressed breaks in the sweet laughter of the young, sound triumphantly the hymns of the glad. It is not all sorrow by which we are surrounded, and the chances by which our future is moulded do not spring out from misfortune, trouble, disaster only. Sometimes these dumb blind drifting chances lead us into fairer pastures than those which we have hitherto known, and the stranger guests entertained at our hearth may be angels unawares as well as crafty men or cruel demons. Floundering in the drag-net of an unscrupulous exploiter—as so often happens to those who are ignorant of the methods of business and too upright themselves to suspect others of evil—poor Gudgeon, marked down for prey, chances to dine with his friend Manifold at his club. Here he meets with a briar man of the world, well versed in all those crooked ways of life which he terms more graphically than elegantly *Dodges*—*Dodges* all in a lump together; drag-nets of exploiters, bubbles blown in the City, and grappling-hooks cast into deed and share by trustees without conscience and speculative solicitors who are 'certain to be able to pay it back when wanted.' Gudgeon has begun to be uneasy about his liabilities; doubtful of the wisdom of his investments; anxious to swim to the mouth of that drag-net and swim himself clear of those inclosing meshes. His intelligence is asserting itself over his more high-souled but less rational habit of trust. He is beginning to see a little light where formerly he had been voluntarily blind; and that little light is shewing him some very ugly things indeed. He unbosoms to his friend Manifold, and Manifold looks grave; when presently there bustles up, rosy, well-washed, brisk, alert, this very bloodhound of *Dodges*—the clairvoyant of rascality—Ferret, the famous Ferret, who seems to know by intuition when a scheme is sound or what he calls 'fishy'—the

word is his, not ours—and whose advice delivered gratis is worth any man's fortune to buy. Manifold hails him, and the perplexities of Gudgeon are detailed. In an instant Ferret has the scent. 'The thing is a swindle, my dear sir, and you must back out of it without loss of time. At the best you must lose, but you need not lose so much as you inevitably will if you remain in the concern. Back out, and blow your burnt fingers cool.'

Gudgeon takes his advice and backs out; and thus saves himself and the partner of his bosom, his little ones and his old mother from absolute destitution—and all by the chance of an If. If he had not walked down Bond Street that fourth of May he would not have met Manifold; and Manifold, who never remembers any one when out of sight, would not have asked him to dine at his club the next day. Not dining at his club, Gudgeon would not have had the chance of a confidential talk in the first place, nor of an introduction to Ferret in the second; and if he had not met Ferret just when he did, and withdrawn just when he did, he would have been laid by the heels helpless; for the bubble burst, and the poor creatures in the drag-net were landed, and the experimenter grew fat while his victims waxed lean, and some of them disappeared altogether. That was an If to be emblazoned by Gudgeon in gold and purple on the whitest and softest vellum to be found; an If which saved one at least out of a crowd lost, and where but for it, that one would have been lost too.

What pleasant days have come about by Ifs!—what charming companionships have sprung, like flowers blooming from a wind-sown seed, from the merest caprice of fate, the smallest, most insignificant little turn of the wheel, with If as the handle working! A day spent in Hertfordshire was the seed which bore the fruit of an autumn's shooting in the Highlands; a garden party at the Lakes culminated in a season passed in town; a ball in Grosvenor Square began the acquaintance which ended, so far as separate acquaintance went, in St George's Hanover Square; though alas! St George's Hanover Square, for one, destroyed all the preliminaries already gone through in the same direction for another. For young eyes are bright and young hearts sometimes unsteady; and Mary was too pretty a bridesmaid not to be admired, while John was too much in love not to be jealous. And when that handsome captain with his tawny moustache and lordly manner, appropriated the pretty bridesmaid to himself, in the manner of a rover bold reserving the best prize for his own share, that rather sullen and desperately jealous lover of hers took fire and fright, and never having had a very firm hold on the girl's heart, lost that which he had, by reason of his foolish temper and unwise display. And so it came about that Mary escaped from his grasp altogether, and the captain carried her off in the end as his own. That was a bad If for John! And yet maybe not so bad after all? Better no wife than one unloving and reluctant; and, as marriage does not heal a jealous temper any more than it makes a sulky one magnanimous, neither does it make a pretty woman anything but an admirable thing to look at, and, if intelligent and pleasant, an agreeable one to talk to. If John had married?—there would then most probably have been a very long and weary way

of misunderstanding to get through before they would have come out into the serene light of peace and confidence, if indeed they ever did. They might have done so badly together that they might have been obliged to separate; or Mary might have pined away and died of that deadly disease known as despair but which is called a broken heart; or John might have taken to drink to drown his self-made cares, or Mary to flirtation of an audacious sort to give him cause for his discomfort. A whole world of eventualities would have hung upon that If, which now hung on the If of the other side. If Ada Crofton had not gone to the ball in Grosvenor Square she would never have met with Morton Ward; Mary would not have been invited to her wedding as her bride's-maid; Captain Duncan would not have been 'best-man' to her sweet seniority on the inside side; and the whole of the after chapter would not have been written—with poor gloomy miserable John going off to Charleston and dying of yellow fever within the year.

If my eldest boy had not bathed in the river that day when heated with cricket, he would not have had rheumatic fever; he would not have been crippled for life; he would have followed the career which had been marked out for him, for which he had studied, and to which he had given his heart; and the army would have had as brave and handsome and high-minded an officer as could be found within the four seas. But he bathed; took a chill; had rheumatic fever, whereby he was crippled, helplessly, for life, and so had to throw up the Engineers, for which he had been preparing with so much zeal and certainty of brilliant success, and take to the law, which he detests and where he will never prosper. And if my younger boy had not met Mr Midshipman Easy, when staying for his holidays at his aunt's, in all probability he would not have been bitten with that fatal passion for the sea which resisted all counsel, all endeavour to control. For though he denied the navy, and kept at school till the age was passed when he could be admitted, in the hope that it was but a fleeting boyish fancy, he slipped his moorings one dark night unknown to any one, and, in his admiration for what some one calls a prison with the chance of drowning super-added, shipped himself as a sailor before the mast on his sixteenth birthday. In this way it was that he began that life of unsettled adventure which has robbed his mother of a son, his country of a citizen, and taken from his career all solid value and satisfaction.

But If I had put him into the navy when he was a lad, according to his desire!

So the round goes on; and to the lives of us all comes ever that shaping and determining If by which good and ill flow together. But of what use to look back?—of what use to lament the inevitable?—to bewail the chance which has wrought out certainty? Wisdom and courage do much to correct the mistakes of ignorance, the misadventures of blind action. We live in a world hedged round on every side with barriers that no human power can overleap, no foresight overthrow; and the great events which spring from small causes meet us at all four corners. Of what use then to fret over the unalterable law? That If by which our dearest have been lost and ourselves wrecked, let it be to us as the unseen and irresistible Force

which governs us, unknown to ourselves how or why. And who but fools beat their heads against stone walls?—who but cowards weep for that which no tears can restore, and no bewailings remove?

THE ARAB WIFE.

A TALE OF THE POLYNESIAN SEAS.

CHAPTER VI.—DINNER.

It was about noon when we arrived at the castle. The place was crowded with bustling servants, and it was evident from what was going forward that the dinner would be a grand affair. I felt more at ease among the Arabs now that I had made my proofs, as the French say, and chattered away freely to all the young pirates who were loitering about. There were not many, for the majority were down at the jetty, superintending the unloading of the ghee, palm-oil, spices, and as much of the other goods as were to be landed. While in the midst of an animated description of the Dutchman's astonishment when we poured over on his decks, a black Seedi slave announced to Abou and myself that we were to take our noon-tide meal with Nizam; Abdallah, a cousin of Abou's, and an old Arab who acted as quartermaster on board Nizam's proa, were to be present also. Abdallah congratulated us on this. He said: 'Feringhi [Englishman], you will certainly receive a big present; a shawl perhaps, or a handsome tulwar, or maybe a pair of Arab pistols.'

'Well,' I said, 'what will you get?'

Abou answered for him: 'Abdallah will get that slave Maime he has been hankering for.'

At this there was a broad smile, and the accused answered back gaily: 'If Nizam chooses, there is room in my house for her.—Abou, what do you expect? Piastres or slaves, or a proa, or what?'

Abou shook his head. 'I make no calculations, and least of all do I expect anything so extravagant as a proa. But we shall soon know, for the muezzin must be close at hand, and after prayers we shall ascend.'

Shortly after indeed, we heard the cry which calls good Mussulmans to prayers; and every one of those who had been chatting so gaily immediately knelt, bending the forehead to the ground nine times and repeating the attributes of Omnipotence.

We soon found ourselves in the reception-room of Al Reis, which was evidently decorated for the purpose. The floor had been covered with a fine Persian carpet of bright colours with quite a brilliant border, and a splendid praying-carpet had been spread over the old sofa. Al Reis was seated cross-legged on the sofa, and motioned us to take our seats on the soft carpet below, and receive food from his own hands. When I participated it was the last course of sweetmeats, and he told me that it was his intention to reward me far more amply than I could dream of, but that his future action was not yet quite clear before him. 'But in future,' said he, 'you must have a room in my house, and I will appoint a slave to look particularly after you and to obey your orders.'

When we had left the room, Abou beckoned to me that he had something of importance to say privately, so he led the way to the wild garden

that surrounded the castle. It was a magnificent spectacle, though it was so little cultivated, for it seemed like a fragment of a tropical jungle which had been dropped by the hand of an enchanter on the naked hill. The place was full of strange fruits and flowers: bushes with huge blossoms as big as a peck loaf; cacti for all the world like twining serpents, with the loveliest flowers; trees twined together like lovers in the Arab style; bowers of jessamine and wild grapes, date palms, talipot palms, cocoa palms, areca palms, bamboo palms, toddy palms—palms everywhere, of which I do not know even the names. In one corner stood a huge tree, whose branches rose from the trunk about twenty feet from the ground, and then swept clear downwards, making a perfect bell tent. There were cypresses, or something like them, with leaves of the darkest green, and oleanders as large as English lilac bushes. Even lilac bushes were here too, only they were large trees, fifty feet high, with slender graceful branches. There were mango trees as big as an oak; guava trees both white and red; jack trees, as we used to call them in India, though I believe they are a kind of bread-fruit. Others too with a stem as thin as the little finger, rising twenty feet in the air without a leaf, and terminating at the top with a circle of bright green leaflets. Underneath these were hosts of curious flowers. One thing, however, was wanting—there was no grass.

Abou led me to one of these bowers of jessamine and wild grapes, and commenced: 'My son, didn't you speak once of a kind of proa much faster than a proa that was used among the Giaours?'

'Yes,' I replied; 'if you mean the pirogue I spoke about a long time ago; but you thought the proa best.'

'I think so still,' said he; 'but Nizam is willing that you shall build one, if you can, and he will give it to me for my own.'

'Well, but what am I to build it of?'

'Whatever you like; you can take what materials you choose—you can have the pick of the whole island. You can do just what you choose. If you build it, I am to command it for myself; and whatever prizes I make, you shall always have the first and best share, you may depend on that.'

'O Abou, I'll be glad to build it as well as I can, for the sake of all the kindness you have shewn me, not for the sake of anything I can make of it. Only I don't know much about boat-building, though I remember what my father told me about the pirogues. You'll have to help me, and get the best proa-builders to help me; and then I believe I'll be able to turn out the fastest and the safest vessel that ever sailed these seas.'

Abou here grasped my hands warmly, and began to dilate upon the splendid times we would have, and the prizes we would take, and what adventures we would seek when the pirogue was finished. I participated in his raptures, and looked forward eagerly to that happy time. I was quite on for the undertaking.

'Abou,' I cried, 'when shall we commence working at her?'

'We must wait,' said he, 'until the things have been removed from the big vessel. That won't take long, for the best part will remain where it is now. Then, when all the Malays and Papuans have left, you can look around and take what you

want. Then when you have got your materials, you and I will begin as soon as Nizam has sailed.'

'Sailed! Where is he going to sail to?'

'He is going to take the big vessel to sell the cargo.'

'Why don't we go with him?'

'Because he does not take us. Besides, we shall have the boat to build.'

With this unsatisfactory reply Abou departed, leaving me in the garden. I wandered around, delighting in the beauties of the place, listlessly plucking the flowers that arrested my notice, until I came to a spot that was all sombre, dark, thick evergreens, extending like a wall. For some reason—I don't know why—I determined to make my way through this dark huge hedge, and brushed through with determination, until I found my way absolutely and completely arrested by a towering fence of prickly-pear. I looked in vain for an outlet, but saw none; so I walked alongside the wall of prickles for some two hundred yards, when I came to a narrow opening in the fence of cacti. I marched in, and found a tortuous passage, very narrow, very winding, which I followed mechanically, being unable to see a yard before me, so short were the turns. At length it broadened a little, and the passage became less winding, and I could hear in the distance something like a waterfall. As I got nearer, I could distinguish the sound as the plashing of a fountain. In a moment I heard women's voices talking in Arabic, and I felt a trifle scared, because I began to comprehend where I was getting to. I knew that if Nizam should find me, my head would leave my shoulders with terrible despatch, and yet I could not resist the temptation to have a look. But I resolved to act discreetly; so I walked with the greatest caution, and on finding myself close to another narrow outlet, I lay on the ground, peeping through the screen of prickly-pear. There were three ladies dressed in the Arabic costume, reclining on the ground and smoking from a narghileh or water-pipe, to which three tubes were attached. They were talking pleasantly about the prize that had been taken, and how the cabins had been nailed up by Abou, and no one knew yet what was in them. Two of these ladies were grown mature women, fine-looking, but rather fat. They had lovely eyes and beautiful hair. But the third was one of the most beautiful women I had ever beheld. Her face was a perfect oval; her hair was a bluish black, and full of natural ripples; her eyes were large, almond-shaped, and full of languid light. My breath came thick. My head seemed bursting, my blood on fire. I had the greatest difficulty in keeping from rushing out into the pleasant garden where they were grouped around the fountain, and avowing my love on the spot. And yet at the same time I felt afraid. Something new had come to me. I was in love, and for the first time. My fate was before me, and all thoughts that I might have had of my father and my country were buried fifty fathoms deep under the flood of impetuous passion that rushed over my soul.

Soon they began to talk again. One who wore a scarlet silk caftan commenced joking Fatima about a screen. Her name then was Fatima. That was so much gained. I knew her name, and my eyes actually filled with tears of joy, because I knew how to think of her. Fatima! What a

delightful name it was! Fatima! It had a sound of inexpressible tenderness!

One of the stout things commenced joking her about a screen.

'Fatima kisses the screen. Lula, will you believe it! Fatima presses her lips in the tenderest manner to the screen.'

'How do you know, Nerinda?' said the other fat thing, looking at the darling Fatima with a horrid smile.

'When my lord had his noonday meal, I just peeped through the curtain in his room, and seeing four men there, I modestly withdrew, when who should I see but Fatima coming to the curtain and peeping through it! Then the poor thing sighed, and pressed her lips to that old screen, and peeped again, and sighed. O Lula, what made her sigh?'

'Stooping perhaps, if her caftan was too tight.'

'Perhaps it was, Lula, or perhaps it was the sight of the handsome Moussoul. He is only seventy, and his beard is not very gray; and his face is not much scarred.'

'Or perhaps,' chimed in Lula, 'it was Abdallah the martial, the heroic Abdallah she was gazing on; Abdallah, who loves the greasy black slave Maime.'

'No,' continued the first speaker; 'it was not Abdallah, and it was not Moussoul for whom she sighed. It was good old Abou, who has two old wives, and wants a young one. It must have been Abou for whom the fair Fatima, the bright flower from the stem of the brave Nizam, pours unavailing sighs and kisses the screen.'

'Of course it was Abou,' rejoined Lula; 'it must have been Abou, because it could not have been the Feringhi. It could not be the baby-faced Giaour.—Could it, Fatima, dearest?'

To my intense delight, and at the same time to my grief and pain, the lovely girl burst into a passion of tears, and covered her face with her hands. The others laughed, and smoked complacently, chatting away on a thousand frivolous subjects.

I remained rooted to the spot. Was it possible that Fatima cared for me, and had seen me? I had noticed the curtain in front of the door in Nizam's room. It led then to the women's apartments, to the zenana. The two ladies who sneered at Fatima were then probably Nizam's wives, Lula and Nerinda. Neither of them could be Fatima's mother, for the eldest looked only twenty-one; and Fatima could not be more than fourteen, though among the Arabs there are mothers at thirteen. And Fatima loved me! Would I ever have an opportunity of telling her how I loved her? When Nizam was gone to sea, perhaps there would be an occasion. How I strained my eyes to look at the object of my sudden but intense love; and how I watched the heaving of her gentle breast, as she sobbed in uncontrollable grief! Soon she ceased to weep, and rising from the marble pavement that surrounded the fountain, disappeared into the house which was close at hand.

I stole away with a mind filled with the most delicious emotion, inwardly resolving that I would make known to the girl my sentiments. The way to do this was not very clear; but I was too sanguine of disposition to doubt for a moment the possibility of the attempt. When I emerged from the walls of cactus, which rose on each side

to a height of twenty feet, I took the bearings as well as I could, and found that there must be quite a considerable garden behind the prickly-pear which was sacred to the females of Nizam's household. It seemed to me that the pirogue which I was about to build would assist me very materially in any plans I might form with respect to Fatima, and I resolved therefore to plunge headlong into building, and seek every opportunity to revisit the garden without awakening suspicion.

Filled with these thoughts, I returned to the court-yard, where I found the greatest activity prevailing. There were fires everywhere, and sheep and kids roasting whole, poultry on spits and seething in pots, slaves rushing about full of importance; in fact the whole place full of turmoil. I watched the scene with amusement. Presently Moussoul the old quartermaster came up with a bright-looking Seedi boy about fifteen, who was assigned to me by Nizam. His name was Bikur, and he salamed profusely, saying how devoted he would be, and all that sort of thing. I told him that if he would be a good servant, I would be a good master; but if he wasn't, then I would return him to Nizam. Upon this he made more salaams and protestations, and indeed seemed very anxious to win my approval. I asked old Moussoul where my room was to be, and found myself soon in one of the towers at the corners of the walls. This really was one of the pleasantest places that could be found, as there is eternal summer there, and a cool place to sleep in is of the greatest importance. I found a large strong trunk with a good lock and key, in which were the clothes given to me by Nizam at the noon-tide meal. And there were, besides sundry conveniences, a handsome sleeping-carpet, and an excellent pair of Arab pistols. The door was fastened by a huge wooden bar. There were no windows; but by leaving the door open the same object was attained.

I dismissed Bikur, and remained in my little room monarch of all I surveyed. My first thought was to secure the door, and to take out my father's jewels from their concealment and stow them away in my box. I spread my carpet, and tried the effect. It was curious somehow, but I felt dissatisfied. While my life had been an adventurous one, I somehow liked it; but this approach to respectability, this room and box of my own, these two suits of clothes, one for holidays and feasts and one for business purposes, seemed too much like the European life that was gone, and suggested comparisons that were disagreeable. A room plastered with mud, with no windows, and no furniture save a carpet and a box, was not pleasant for one who knew what a room should contain. I must confess that my mind became filled with a train of despondent reflections, when the thought of Fatima came to nerve me to endeavour and to give me an object powerful enough to dispel thoughts of home, that actually for the first time intruded on me. I proceeded at once to don my holiday garments, stuck my sabre and pistols in my shawl, and descended into the court-yard just as the muezzin had called to prayer.

As soon as prayer was over, hundreds of torches were lighted; and the Arabs generally, and the Malays who were invited or had invited themselves, attacked the various good things that had

been prepared *al fresco*. We who were the guests of Nizam followed him to the room where we had been on former occasions, I wondering where we should dine, as the room was not large enough to contain us all. But the curtain which I looked for had been removed, and we passed into a much larger room beyond, at the end of which was a lattice-work partition of bamboo, behind which we could see the indistinct forms of women. There were some thirty guests in all, including six Malay chiefs, whose religion does not seem to interfere with their eating anything and with anybody. For some reason Nizam desired to shew them particular honour, so they messed in a circle with him. We, the four who had eaten with him in the morning, were by ourselves, and the others formed groups of four, and squatted where they chose. Then followed an endless series of pilaws, kabobs, kitcheries, roast-meats, sweetmeats, and fruits. At the end of every course we had sherbets, and the slaves sprinkled us with rose-water. It was like being in the Arabian Nights. We had also a tiny speck of attar of rose in its pasty state stuck in the ball of our thumbs. This I believe is considered the acme of luxurious living. There were a few curries prepared, out of compliment to one or two Arabs who had lived in Hindustan, and I gladly seized the opportunity of eating food to which I had been so long a stranger. The way of eating was strictly with the right hand; and when the roast-meats were brought I wondered how we should tackle them. But Abou just seized the bone with his left hand, and with inimitable dexterity tore a piece off with his hand. To use the knife at a great feast is considered ill-bred, because the knife may be used for warlike purposes; so with the roast-birds, which were brought round hissing hot on the spits, each man tore off a wing or other portion with his right hand. For the curries we used our fingers.

When we had completed the repast, which must have lasted three hours, servants brought ewers and basins of water as usual, and then we had coffee and pipes. During the meal I stole as many glances as I dared towards the lattice, and my heart throbbled with deep joy when I caught the tender glance of a dark eye fixed on myself. I felt sure it was Fatima, and I vainly puzzled my brain for some way of communicating my sentiments; but I could think of none, and the guest left the room before I had decided on anything. I hurriedly went to my room, changed my gay attire, and taking with me my sleeping-carpet, resolved to pass the night in the garden under the dark evergreens.

CHAPTER VII.—LOVE.

Night-time at Gezireh was the most delicious thing imaginable. It was quite a luxury to breathe the air of that enchanting spot. Simple existence was happiness in itself. As I passed through the garden, the air was heavy with a thousand nameless perfumes, among which the Indian jessamine asserted itself as the strongest. I had thoughts of sleeping in one of the arbours twined with this plant and the wild grape, but I do verily believe the perfume would have suffocated me. I went on gathering handfuls of sweet flowers out of pure romance and ecstasy, and suddenly the thought flashed over me that I would make a bouquet and leave it beside the fountain. I did not know

enough Arabic to make it symbolical; but I remembered that the almond flower is a sign of marriage, because *fistek* (almond) rhymes with *yastek* (pillow); and two almond flowers on one stem represent, in the language of signs, two heads on one pillow; and that was about all I did know. There was no moon; but I was determined to find an almond tree if I could by the smell; and so I wandered up and down for hours, constantly coming across trees which I believed to be the right ones, but which turned out to be oleanders. At last I came across a veritable almond, and selected the most beautiful twin blossom I could find. Around this I grouped some pretty blue and white flowers, and I made a background of dark crimson leaves and another of green ferns. Then I hurried off in the direction of the evergreens, and made my way to the prickly cactus hedge, through which I steered with great caution, as there was no moon. At last I came to the opening, and cautiously stole into the open space. There was light enough from the stars to discern everything dimly, and I made for the fountain without hesitation. Placing the bouquet at the edge of the marble pavement, I wrote as well as I could, in Arabic characters, the word *FATIMA* in the sand, devoutly praying to the god of love that she might be the first to come down. Then off I trudged, as happy as if I had found a diamond, and picturing to myself how she would find it, and press her lips to it, and perhaps write love-messages in the sand, and then chase them, looking guiltily around. And in this frame of mind I emerged from the garden, determined to sleep on board the vessel after all. When I got to the jetty, I found sentinels placed on board, who saluted me respectfully, which I was very glad of, and made no objection to my entering the saloon, and spreading my sleeping-carpet on the table. I soon went to sleep, and dreamed all night of the Arab maiden.

In the morning I was aroused by Abou, who told me to hurry with my toilet, for that Al Reis was coming. If there are people in England who believe that Arabs are uncivilised, they are greatly mistaken; for they wash repeatedly, and are extremely punctilious as to their nails, beard, &c. And I verily believe that this was one of the reasons why I was so great a favourite among them. Soon Al Reis made his appearance, attended by a couple of his spearmen, and saluted us both, we kissing his hand respectfully. He directed the spearmen to wait outside the cabin, and not to permit any one to enter under any pretext. Then he told me to open the grand cabin doors, which I quickly did with the claw of a big hammer; and Nizam entered, followed by Abou and myself, all of us thrilling with curiosity. The stern cabins were much the same as others, except that there was a large cage of Java sparrows, all of which, poor little things, had been starved to death. Nizam patted Abou on the shoulder, and called him 'Old Fidelity,' since it was plain that Abou had not even glanced in for a moment before nailing up the doors, or the poor birds would not have been sacrificed so cruelly. There was a little room at one end of the sleeping-room, which I knew to be the bullion-room, and I represented to Nizam that perhaps we had better look for keys in the writing-desk. He nodded assent; and sure enough there was a large bunch on a ring, one of which was a peculiar brass key of English or American make. I said

that I thought this would prove to be the key of a safe or iron chest for holding money; and we all proceeded into the little room, where indeed was a safe, as I believed, with a great brass trade-mark on it of some New York Company. I gave the key to Al Reis, and told him not to turn it, but to slip it in, and it would open. He did so; and the door of the safe swung open immediately, to his great satisfaction. He viewed the ponderous doors with surprise, and I am convinced was more delighted with the safe repository he had obtained for his treasures than with the treasures in it.

There were heaps of papers, which he handed to me and told me to read. I glanced at them. They were in Dutch, which I did not understand, and I handed them back to him. But he told me to keep them all, and perhaps I might make out something. We found diverse boxes of small size, which were opened by various keys on the ring, and in one was a mass of gold mohurs, between four and five hundred, and several bundles of papers, which he handed over to me to make out. My heart gave a leap as I recognised English bank-notes to a large amount, and Bank of Amsterdam paper also for many thousand guilden. Nizam took the box of gold, giving us each a handful, for which we made him many salaams. We were all by this time in excellent humour, and Nizam was uncommonly gracious. I could have embraced him for Fatima's sake, and I did kiss his hand with such enthusiasm as both astonished and pleased him.

The next thing we examined was a common enough box of sandal-wood, on which were large seals. It had been covered with a wrapping of cocoa-nut fibre, which Abou had cut off with his knife. Nizam's eyes flashed fire.

'What seal is that?' demanded he.

'The Dutch East India Company,' I replied; 'and it must be either precious papers or something of great value.'

'Look about you, my children; I will return to the cabin and examine it there,' said Al Reis, who did not wish to exhibit emotion before us, as he held evidently what the Dutchman had considered the most precious part of his cargo.

Abou and I found another box of gold and more bank-notes, which were at once intrusted to me, and which I carefully stowed away with the ship's papers. This exhausted the safe. But around in the bullion-room, which was sheeted with iron, were boxes of much larger size, full of seed-pearl, and bags of rupees and dollars, all in silver. We hastened in to tell the Reis of our good fortune, and found him in a state of great perplexity. He had broken open the sandal-wood box and exposed to view a casket of polished steel, richly chased with gold. This he had endeavoured to open with every one of the keys, and had failed. He was then trying to force it open with the point of his dagger, but fruitlessly. Leaving it with a sigh, he returned to the bullion-room to count the silver. There were eighty thousand American dollars, and fifty thousand rupees, all in bags of a thousand each. We handed him the box with the gold, and he ordered us to open our two hands, which he completely filled with coin. Then he gave us of the same measure five times of silver dollars, which we wrapped up in the linen kopra worn by Arabs, and which serves as a sheet at night-time. The seed-pearl

he said he would sell at Muscat, or perhaps at Bushire in Persia, or at some port in the Gulf of Oman. He offered us some; but what could we do with seed-pearl; so he promised that he would remember us in the sale. Clapping his hands for a slave, he said he would order mid-day meal for us all, on board; but no slave appeared, which made him angry. So, going into the saloon, he shouted: 'Balu, Honua, Byagi;' and shortly Malays and Papuans came running; but the sentries would not admit them; at which piece of obedience Nizam remembered his order, and was well pleased, giving to each spearman a piece of gold. He ordered one of the black fellows to send for his Arab cook, and order him to prepare food on board the ship. Then we returned to the cabin, and Nizam asked particularly if I could make anything out of the papers. I said that I could make out the name of the ship, because it was printed in Roman characters, not in the Dutch character, and was a Greek name, Antigone, but that was about all. At this he seemed disappointed. He thought for a moment, then said: 'My son, and you, Abou, whom I love above all my Arabs, there is surely here some great thing. I am not one of those foolish ones who believe in charms and spells and in magic caskets. Nevertheless, here is a casket which I do not see how to open, nor indeed can I see a keyhole. The secret to open this must be in the papers. Look for yourselves.'

We examined the casket, Abou first, and I afterwards. Abou shook his head. When I saw it I gave a cry, for I recognised one of these curious locks which open by a secret word. Arranged in a circle were all the letters of the alphabet, and out of them by transposition was to be formed a word which would open the casket. I explained this to Al Reis, who comprehended it at once, and promised me a large reward if I could find out the word. 'But,' said I, 'Al Reis, there are twenty-four letters. Only think how many combinations might be made. Just think of it. I have heard of these things before, and the name is never written. The man who has it has to remember it.'

Then he promised me anything that I might ask if I would persevere and go through all the papers.

'But, Highness,' I broke in again, 'how am I to know when I am right unless I have the casket? I must try every word with the letters themselves.'

'No, no; I will try myself.'

'But you can't understand Roman letters.'

'I will learn. My daugh— I have some one who can teach me.'

I did my best not to look thunderstruck, but I fear I made a very poor attempt. So I promised that I would make out a list of words for him; but I tried to convince him that the hope was futile, as the twenty-four letters contained every possible word in every possible European language. Nevertheless, I would examine the papers carefully.

The meal was brought in, and we had a merry one. Nizam told us his projects for the sale of the cargo; how he would be obliged to go to Arabia, not so much to dispose of the cargo, but to get Arab recruits in sufficient numbers to have a full crew for the vessel, which he dubbed *The Shark*. Abou and I were to remain behind, and build a pirogue according to my ideas; and I was to examine the papers thoroughly, to gain the clue to the word. He intended, if possible, to get a

hundred Arabs, which would give us a complete control of the pirates. His present power was founded on his knowledge and his bravery, the Malays being alone six times as many as we were. With a hundred more he would feel in security when he was away. Abdallah, whom he relied on greatly, and Moussoul would command his proas, which would be manned with a few Malays and Papuans; whilst to Abou and to me he would commit the safety of his castle and his possessions. He relied on us to keep the pirates on friendly terms, and to conceal all knowledge of the silver on board. The gold he intended to exhibit, and the seed-pearl. The silver we must put in the safe and fusten. Then we would lock up the bullion-room, and say nothing about its existence, and by putting a curtain in front of it, the Malays would take it for the zenana, and would ask no questions.

This we did accordingly; and Nizam sailed in *The Shark*, taking with him the greater portion of the Arabs. Then Abou and I set resolutely to work at the pirogue, being daily surrounded by curious Malays, to whom we explained our intentions. Some thought the proas they made better; others were taken with the novelty of the pirogue; and when I assured them that she would beat a big vessel sailing with a moderate wind, they would have gone to work immediately, and made imitations of the one we were engaged on, if the head-chief, Tamula, had permitted. But he being a prudent man, told them to wait and see how one would turn out before they adopted an untried idea.

Meanwhile I went every morning before daybreak with a bouquet, which I laid near the fountain. Some one took them away regularly, which gave me strong hopes that Fatima was aware that I loved her. I had purposed originally to have waited until Tamula set off on an expedition with the proas, which would rid me of the supervision of Moussoul and Abdallah. Good old Abou never said to me, 'Where goest thou?' or 'Whence comest thou?' but those two I fancied looked after me a trifle more than was friendly. I believe now that this was imagination, but at the time it irritated me. One morning, however, I determined, whatever happened, to wait and see who took my bouquets. I made one as beautiful as I could, deposited it in the usual place, and retired with beating heart to the edge of the prickly pear-hedge. The sky was soon all rosy with red clouds, and a warmer flush stole through the air, and a twitter of birds awoke in all the branches. Soon up came the cheery sun from the depths of the sea, and a flutter of life arose down in the Malay town. My heart came to my mouth as a vision of light garments came tripping from the door of the house, and the beautiful Fatima came direct to the bouquet, and seizing it with a glad cry, pressed it to her bosom and to her lips. Her hair was all loose, flowing down her perfect form; her eyes were bright with youth and happy love, and there was a look of eager fond expectation thrown around the garden, as if in search of some one, which thrilled me to the core. I could endure silence no more, but left my covert, crying softly: 'Fatima! Fatima!' She turned at the cry, and gave one long look, and then ran to meet me all love and joy. We embraced with the utmost

passion; and whilst the words 'I love you!' trembled on my lips, she anticipated me, crying: 'Ah love! I love you!'

With the instinctive caution of an eastern girl, she retreated with me to the covert of the hedge, and there behind the cactus gave full course to her affection. I replied as ardently, and we confided to each other how we loved from the first glance. An hour of this heavenly intercourse passed like a moment, and we parted with mutual pledges to meet again that evening. When I went down to the jetty near which our pirogue was building, I found Abou and our workmen in full swing. I determined to spare no pains to hurry on the completion of this vessel, as I foresaw that I might want to elope with the daughter of my chief, and the pirogue would exactly suit. She was to be made principally of stout bamboos, the calking to be of india-rubber below the water-line, and above of cocoa fibre. Her lines were to be like an English schooner, and she was to have two broad lug-sails, with foresail and jib. The deck was to be flush, with grooves for the fitting of powerful sweeps, to be pulled in a calm; and below was to be a large saloon with a good stern cabin. Such was the programme. The timber we wanted had been partly taken from the Dutch vessel, with spars, sails, and cordage; and as we could not have a wheel, we were to have a tiller.

Having now a new impulse for working, I went at it like a giant, and assisted with an enthusiasm which delighted Abou, who—may I be forgiven—thought that it was from friendship to himself. Old Moussoul came down and nodded approbation; and now that we were working on the flush-deck things began to look a little more ship-shape. I told him that we wanted sadly a wheel and a capstan, and entreated him if he came across any European vessels on the next cruise to bring them along. I shewed him how we would arrange the planking so as to fit in the capstan when it came, and cautioned him not to take a big one, but only from some vessel about four hundred tons. Though this would still be above our size by far, yet there are few vessels of smaller size in the eastern seas, and this he knew. He told me that he would not forget, and that arrangements were then pending for a cruise in a few days, which I was exceedingly glad to hear.

In the evening, after dinner, Abou wanted me to sit and sip coffee whilst Abdallah told Arab stories, in which he was very accomplished, and could recite the Seven Poems of the Moallakat and the feats of Antar so long as breath remained. I was usually very glad to hear him, but this time I excused myself on the ground of a headache, and retired; Abou thinking that it was from working too hard, and cautioning me from abusing my strength and endurance. Immediately I made for the place of rendezvous, and there found my darling, who flew to my arms with such fervour that I involuntarily shed tears of happiness. On perceiving this tribute to her charms, she gave me a heavenly smile, which even the starlight could not hide, and we were at once overwhelmed in mutual confidences. I told her all about myself and my life with the Arabs; and she told me that her mother was a European whom Nizam had captured, and whom he had made his wife and the chief of his zenana. She pined away, however, and died when Fatima was only three years old. Nor did the

dear child know what country she belonged to, but she remembered two words which her mother used to say: 'Anima mia.'

'Anima mia!' cried I; 'why, that may be Spanish or Italian.'

'What does it mean, love?'

'It means "my soul."'

Here Fatima laughed a delicious ripple of music, and said: 'You then are my anima mia.'

'And you mine.'

'Ah, dearest Feringhi, I cannot speak your name as you can mine. Teach me to say it.'

Then we tried. She could not say Charles; she would say Tsarlis and Sarl; but she could not arrive at the name; so I taught her to say Carlos, which I told her was the way her mother would pronounce it, and that it was the same thing.

Thus fleetcd the happy hours of newly-dawned love, during which I told her about the pirogue I was building; and how, if her father would not consent, we would take it and run away. The answer to this was a pressure of the lips, and the words—whispered in the sweetest voice that ever woman had: 'Carlos, anima mia, where you go, I will go; what you do, I will do; what you worship, I will worship; and when you die, I will die. Take me, Carlos, for I am yours.'

(To be continued and concluded next month.)

COINCIDENCES IN DATES.

IN an article lately given by us on 'Unlucky Days,' we illustrated the proneness exhibited so widely in society to attach importance to numbers, days, dates, as having some mysterious connection with the unfavourable incidents of human life; as if an overruling decree of fate or destiny had settled the whole affair for us, without leaving us the power of preventing or setting it aside. It will be found, on further examination, that this is especially marked in connection with sovereigns, princes, and great personages generally, more particularly in the years of their birth, accession, deposition, and death.

One singular mode of fishing out the connection (for a fishing it certainly is in many cases) consists in adding up the digits or numerals in a particular date, and comparing this sum with the date itself. Thus, the present year, 1876, is expressed by four digits (one, eight, seven, six) the sum of which amounts to twenty-two; and the 'fishing' would consist in catching any peculiar relation or connection between twenty-two and 1876. The French have taxed their ingenuity greatly in this kind of thing, with results which are at least curious if nothing more. Many examples of this will be found in an article on 'Coincidences,' in No. 366 of the *Journal*, which we need not repeat; a few in addition will suffice.

Take, for instance, some of the French sovereigns who flourished several centuries ago. The crotchets-mongers have discovered, in four cases at any rate, a numerical connection between the order of succession on the one hand, and on the other the sum of the digits in special dates rendered memorable by noteworthy events in the lives of the respective sovereigns. Louis IX. was born in 1215; the sum of these digits is nine. Charles VII. was born in 1402; the sum of these digits is seven. Louis XII. was born in 1461; the sum of these digits is twelve. Lastly, Louis XIV. was crowned in 1643,

a date the digits of which sum up to fourteen. In regard to an intermediate sovereign, Louis XIII., the accumulation of coincidences (so to speak) is really very curious. We must first remind the reader that in the old court language of France 'Louis' was spelled 'Loys,' that this king's French Christian and surnames were 'Loys de Bourbon,' and that those of his queen were 'Anne d'Autriche.' The figures came out thus: Louis XIII. married Anne of Austria in 1615; the sum of these four digits is thirteen; 'Loys de Bourbon' comprises thirteen letters, and so does 'Anne d'Autriche;' the boy-king and girl-princess were each thirteen years old at the time of the marriage; he was the thirteenth Louis of France, and she the thirteenth Anne of Austria.

Come we now to the nineteenth century, with which mystical Frenchmen have been equally busy. Bourbonists, Bonapartists, Orleanists, Republicans—all are cited to supply materials for the same story. The great French Revolution, which brought so many momentous events in its train, began in 1789; the sum of these four digits is twenty-five, which, added to 1789, brings us to 1814, the year when the Emperor Napoleon went captive to Elba, and ceased his European conquests—although there was destined to be one more year of struggle in the battle-field. When Charles X. was deposed in 1830, a contest arose concerning his successor; some politicians wished for the appointment of another Bourbon, while others preferred Louis-Philippe, Duke of Orleans, as a representative monarch or 'citizen king.' The Chamber of Deputies decided on the latter, by two hundred and twenty-one votes against one hundred and eighty-one. The Bourbonists sustained a defeat; but they solaced themselves by pointing out that by expressing the numbers in words instead of figures, and taking the alphabetical order of the letters in the words, they could prove two hundred and twenty-one to mean 'La queue de Robespierre,' while one hundred and eighty-one meant 'Les Honnêtes Gens.' We have not quite succeeded in realising this bit of reckoning ourselves; but the Bourbonists very much relished the idea of proving their adherents to be 'virtuous or honourable persons,' while their opponents were merely 'the tail of Robespierre.'

We have had a little of this sort of thing in England, and possibly a due exercise of ingenuity might convert the little into much. Charles I.'s son, and eventual successor, was born in 1630; the sum of these digits is ten, which brings us to 1640, the year when the short parliament began to make short work of the kingly power. Again the sum of the digits in 1640 is eleven, which brings us to 1651, the year when the battle of Worcester drove Charles II. into exile. One more instance: George I. ascended the British throne in 1714, which added to thirteen, the sum of its digits, makes 1727, the date of his death.

But apart from, and in addition to, these numerical conundrums involving the summing up of digits, there are many associations of particular years with certain persons, families, and dynasties. The year 1809 was marked by the death of Haydn and the birth of Mendelssohn; the sum of these digits (availing ourselves of one more illustration of this class) is eighteen, which, added to 1809, brings us to 1827, the year marked by the death of another great composer, Beethoven.

The year '88 is associated with a train of events, none of them cheerful in character, concerning the House of Stuart. For instance, in 1388, Robert II. first Stuart king of Scots became little more than a nominal sovereign in the hands of the nobles, and died two years afterwards; in 1488, James III. of Scotland was murdered; close to the ominous '88, but really in 1587, the beautiful, erring, hapless Mary Queen of Scots was beheaded; in 1688, the last Stuart king of Great Britain, James II. (James VII. of Scotland) was dethroned; and in 1788, Charles Edward Stuart, who had been known forty years previously as the Young Pretender (the 'Bonnie Prince Charlie' of the romancists and balladists), died in a foreign land, unhonoured and almost uncared for. In twelve years another '88 will come; is there another Stuart anywhere, to come under a cloud in that year?

In some instances one particular month in the year, and one particular day of that month, are claimed by the believers in the star of destiny as being associated with one particular personage of note. Destiny or no destiny, it is a fact that the 24th of February was thus associated with the Emperor Charles V., the 2d of December with the late Emperor Napoleon III., the 14th of May with Henri Quatre, and the 13th of October with King Otho of Greece. In the dreadful religious wars of the sixteenth century in France, Huguenots massacred Catholics in Bearn on the 25th of August in one year; and Catholics massacred Huguenots on the 25th of August three years afterwards. The stern Puritan and the gay monarch who had so much to do with the moulding of English history during the seventeenth century, had each his particular association with one special day in the year—Oliver Cromwell with the 3d of September, and Charles II. with the 29th of May.

A crotchet has been started (we do not know by whom) to the effect that the number three is peculiarly stamped on the royal dynasties of England; that after three sovereigns of any one dynasty, either a revolution takes place, or a passing of the royal sceptre to a collateral line. It is certainly the case that the House of Blois came in under Stephen, in virtue of his father's marriage with a daughter of William the Conqueror; that Edward II. was dethroned; that Lady Jane Grey, through her relations and adherents, made an attempt to gain the throne; that Cromwell made a gap in the Stuart line; that James II. was driven out; and that the House of Hanover came in on the lapse of issue to the House of Orange and to the Protestant branches of the Stuarts—these are admitted facts; but nevertheless we must confess to have failed in an attempt to reconcile other known events in English history with this number three theory.

Without reference to any particular months, we find a particular day of the month pitched upon as intimately affecting certain kings and great people. We have already had occasion to mention the way in which number fourteen affects the career of Henry IV. of France; and we may add that, determined that he shall not escape without paying as much homage as possible to number fourteen, the French computers have made out two whimsical calculations—that the year of his birth completed fourteen centuries, plus fourteen

decades, plus fourteen years; and that he lived four times fourteen years, plus fourteen weeks, plus four times fourteen days.

Days of the week have not been lost sight of by those who take an interest in ferreting out the supposed fatality of dates—such as Tuesday to Thomas à Becket, Thursday to the Tudors, and Saturday to the Guelphs.

Two remarks suggest themselves: the first is, that we do not hold ourselves responsible for the accuracy of the several dates set down in this article; some seem to us not quite free from doubt; and in regard to all of them, the writer virtually says to the reader: 'As it was told to me, so do I tell it to thee.' The other remark is, that even if all the coincidences are verifiable, they do not necessarily presuppose any mystical influence of destiny or fatalism. They are quite explicable on the Theory of Probabilities, the Doctrine of Chances. The odds may be millions to one against a particular coincidence; yet that one coincidence *may* present itself in the natural order of things; and when it does, it excites more than usual attention.

LEFT IN CHARGE.

IN TWO CHAPTERS.—CHAPTER II.

A MOST pleasant day followed. I found Mr Gordon a more than ordinarily entertaining companion. He had evidently travelled a great deal, and possessed a fund of general information, which he quite understood how to make the most of. I pressed him to extend his visit for a few days, at all events until my wife returned, and he seemed nothing loath; the business in London might after all be postponed; and in such pleasant quarters, he said, he would be very glad to remain. So two days sped agreeably away; and on the morning of the third, I happened to be sitting in the library, when, to my astonishment, I heard a smothered sound of voices in the drawing-room, as if in whispered conversation. I was just going to get up to see from whom the sounds proceeded, when Mr Gordon appeared in the doorway. It might have been fancy—it was treated then by me as such—but I did imagine he started and looked somewhat disconcerted for the space of a very brief moment; the next he was himself again.

'I have been looking over your daughter's music-books,' he said. 'Is she a very accomplished musician?'

'She sings a good deal,' I replied, 'and is very fond of it; but I can't say she is *very* accomplished. She takes after Arthur in her love of music.'

'Ah! indeed,' responded Mr Gordon.

'Does he still carry about his flute?' I asked.

'No; I don't think so,' he answered rather dubiously.

'By the bye,' I said presently, 'did you notice the new photograph we have of him in the drawing-room? He sent it to us about six months ago.'

'No; I didn't observe it,' he replied.

'We can have a look at it now then,' I said, rising as I spoke, and leading the way towards the adjoining room, followed closely by my visitor.

The photograph, which was hanging on the wall with several others, was a large and most life-like representation of Arthur; it was absolutely impossible for any one who had once seen him to

mistake it; nevertheless, to my unutterable but silent surprise, Mr Gordon directed his gaze towards *another* photograph. Whether his quick instinct or my involuntary correction of the mistake by an indicating motion of my hand towards the real picture helped him towards a rapid rectification of his error, I could not tell. The little incident passed by; the photograph was duly admired and pronounced a most capital likeness; and we passed on to other topics. But an impression was made upon my mind—an impression I could neither resist nor account for, nor dismiss, in fact could hardly have shaped into words; but nevertheless it was there—an intangible something—a doubt, nay almost a dread, of my visitor; for I have owned I am a nervous man, and for one of that temperament to begin to conjure up fancies is certainly anything but conducive to *gaieté de cœur*. I was, in truth, reduced to a condition of nervousness which it required all my efforts to conceal.

I would not press Mr Gordon to stay; I did not feel so cordial to him—that was the truth; and I was growing more and more uncomfortable at what my wife would think of my having done so at all. How glad I would be to see them all back again. The time had never dragged so wearily as on the third day of Mr Gordon's visit. I don't think I have mentioned that it was in the month of October that all these things happened; the days were getting shorter and shorter, and on this particular one darkness had come on more than usually fast; it was raining too; so we—my guest and I—sat in the library carrying on a rather vapid conversation. At last the servant appeared, bringing in the moderator lamp, which, with its shade on, she placed about the centre of the table by which Mr Gordon was sitting. His hand was lying listlessly upon it, and for the first time I observed the peculiar size of it, and the long lithe fingers—very bony and thin, except at the tips and joints, which were of extraordinary proportions. A powerful hand—a clasping, clutching-looking hand—not a pleasant one to encounter in anger. I could fancy—here I again indulged in a terrifying reverie; but I checked myself; I called myself a fool. I, a man come to my time of life, giving way to such absurdities; it was degrading! I banished them as well as I could; but the light from the lamp still fell so directly upon that hand, that I was glad when the announcement of dinner caused a thorough interruption to my musings. We did not sit up so late that evening—neither seemed disposed to do so; and at about half-past ten I found myself safely shut up in my bedroom, preparing for rest. What prompted me, I do not know—it certainly was not according to my usual custom—but it occurred to me to take out and examine my revolver.

There it was lying snugly in its case; but—did my eyes deceive me, or was I dreaming!—the cartridges were gone!—the pistol was empty. I stood transfixed for a few seconds; a cold thrill ran down my backbone. I could not doubt who had done it; and as is the case with a drowning man, before whose eyes, they say, in the short space of time during which semi-consciousness remains, a lifetime of events flashes by, so did a thousand suspicious circumstances connected with my brother's friend flit through my brain. I had been deceived; he was without doubt what, almost unconfessed to myself, I had been thinking he was all that day—

an impostor and scoundrel, who meant not only to rob my house, but to murder me, if I attempted the faintest resistance.

That he was one of the gang going about, I also suspected; and if that supposition was correct, doubtless he had more accomplices, who would come to assist him in his depredations. It was not a pleasant position for a man to be in, however brave he might be, and for me it was simply terrific.

It would be madness to go to his room and confront him; such a course would only precipitate matters; I must act promptly; whatever I resolved to do must be done, and done quickly.

It was a stormy and tempestuous night; the rain was beating upon the windows in perfect torrents, and the wind was high. That was in my favour; for I resolved, after a short period of deliberation, to lose not a moment in leaving the house, and slipping round to the stables, to saddle my horse, and gallop as hard as I could to Lowton for assistance. I had not undressed, so no time was lost in making my exit from my bedroom, the door of which I locked, and also closed and locked the dressing-room door which led into the bedroom, leaving the door to it, which opened on to the landing, unlocked, so that if my suspicions were correct—and I doubted less and less that they were so—the seizure of the plate would suffice to keep intruders occupied, and prevent them from so soon discovering my absence.

At last I opened the window, which was not very far from the ground, and dropping gently down, cautiously crept round to the back-yard. I feared Rover might betray me; but as I got close to his kennel I was astonished to hear no movement.

'Rover!' I said softly, 'good dog! Rover, old fellow!' But no answering sound greeted me; all was silent, except the steady splashing of the rain and the howling wind.

'Rover!' I repeated, 'Rover!' bending down and thrusting my hand into the kennel, in my anxiety for my favourite almost forgetting my possible danger.

I felt the familiar head and rough coat; but it was a lifeless body that lay so motionless under my anxious touch. Rover was dead! A cold dew broke out all over me. I was speechless with rage, grief, and indignation. But there was no time to indulge in such feelings; assurance had now been made doubly sure; the same hand that had drawn my cartridges had poisoned my dog, and would as ruthlessly take my life away, if deemed expedient.

To gain the stables and to slip the saddle on my horse was the work of a few moments only; and favoured by the noise of the raging elements, I led him out with the certainty that no one in the house could hear what was going on.

Quietly we passed through the gate; and I glanced up towards the direction of my guest's chamber, from which I could see a bright light proceeding. That was satisfactory; he had not begun operations yet. Then I mounted, and choosing a back way, by which some distance was saved, and by which I fancied I ran less risk of meeting any possible confederates, I set off at a hard gallop for Lowton. It was a four-mile ride to the police station, but I got over it in something less than fifteen minutes. It did not take long to

explain my errand, which I did by simply stating that I had suspicions something was meditated, from the combined facts of Rover's death and the drawn cartridges. I mentioned Mr Gordon's being with me, but was careful not to commit myself to any actual implication of him.

It did not require any persuasion to get a couple of stalwart constables to accompany me back—they were so anxious to succeed in capturing the thieves that not a chance was thrown away. It was early still, comparatively—we might get back considerably before twelve; and the inspector, who evidently thoroughly grasped the position, proposed that we should regain the house by my window, and await the course of events from my bedroom. Accordingly, leaving my horse at Lowton, the two policemen, myself, and a third constable driving, started off after a short delay, in a small car which we left by itself, tying the pony to a gateway, about a quarter of a mile before reaching my place. Having first taken a ladder from the stable, we groped our way to the front of the house, and as we got there, I touched one of my companions lightly on the arm, and in a whisper directed his attention to the dining-room window. Through the creaks of the shutters we could plainly see a light was burning. Losing not another instant, I clambered up to my half-open window, followed quickly by the policemen, and there we stood, hardly breathing, to listen. Everything was just as I had left it. They had not missed me yet; probably the dressing-room had not been visited, but that would follow immediately, for hardly had we been five minutes in the house before a noise, slight in itself, but still sharp and unmistakable, warned us that some one was ascending the staircase—stealthy footsteps, voices muffled, but distinctly voices—and presently the dining-room door was softly opened, and we could distinguish a word here and there of a whispered consultation. Then came a slight metallic sound, and a crack as if something had given way, a jingle of silver—probably my grandmother's tea-pot, our most precious heirloom—and then the hurried crinkling of paper.

Still the inspector moved not. I myself was becoming quite rigid with nervous excitement. I had fancied the police would have rushed in upon them at once; but no; there he stood, grasping his baton, immovable, as I could see by the expiring light of the fire, which I had fortunately chanced to replenish just before my discovery of the drawn cartridges.

What was he waiting for? It was soon explained to me: they had not all come up-stairs. More footsteps, more voices, and then a hand was laid upon the handle of my bedroom door, with no great regard to the continuance of my supposed slumbers.

Locked! and an oath, not necessary to record, here followed. Then came the sound as of something vainly inserted in the keyhole, and then—that failing—there was a united crash against what really was a fragile doorway, and the next instant what seemed to me a crowd of ruffians came trooping in. There really were three men—quite enough to have robbed and murdered me many times over, but not too many to be trapped and caught in the neatest and simplest manner by the triumphant constables, who, without a second's hesitation,

surrounded the astounded burglars before they had time to realise the situation; foremost amongst them I recognised my brother's friend, Thomas Gordon, my agreeable visitor!

Resistance was useless: they had left their arms behind them; more than one murderous-looking little weapon being afterwards found in the dining-room which they had so recently quitted. Besides which, my poor little strategy—devised out of very fear—had so far succeeded. I had purposely every night left out a couple of bottles of heavily drugged wine, which the unwelcome visitors had unsuspectingly disposed of, and which in a short time began to tell visibly upon their faculties; so they were easily secured, to the delight of the neighbourhood, and to the infinite credit and renown of myself, for I was supposed to have signalled myself most brilliantly, and was immensely congratulated upon my midnight ride to Lowton, which bade fair to become as famous as Dick Turpin's memorable exploit.

No one was more surprised at those praises than I was myself; for the fact remained, and does remain to this day, that I am a very nervous man, and what I did was done out of sheer desperation and terror; and if I had guessed what lay before me when my family went to London, I should have bidden them a final farewell, for I never could have fancied surviving such a night.

Sir Clifford Ransford's butler identified the *ci-devant* Tom Gordon, *alias* Joe Billings, as his assailant; and the other two, also well-known characters, were also convicted. They were sentenced to ten years' penal servitude, and I devoutly hope without the chance of a ticket-of-leave, for without doubt they would remember and repay with interest my share in their capture.

One member of my establishment was missing on the following morning after the seizure, and that was Mary the parlour-maid, our new servant, through whose agency, doubtless, Mr Gordon had carried his personation of my brother's friend into execution.

A ROMANTIC INCIDENT.

In a work of topographical interest, abounding in beautifully printed wood-engravings, styled *Rambles in Galloway*, by Malcolm M'Lachlan Harper, lately published, occurs a short account of the picturesque Orchardton Round Tower—the only tower of this kind in the south-west of Scotland. It stands in a woody piece of country near Castle-Douglas. The writer says that the tower, which is evidently the relic of a feudal keep, is 'chiefly interesting as being associated with a very romantic incident in the life of a former proprietor of the estate of Orchardton, whose history formed the groundwork of Sir Walter Scott's novel of *Guy Mannering*. The account here given of it is from *Family Recollections*, by Miss Goldie, and is perfectly reliable.

'It is there related'—that is to say in the work of Miss Goldie.—that "soon after the battle of Culloden a number of prisoners were one day brought in by a party of military before Mr Goldie, then Commissary of Dumfries, who had, alas! no alternative but to order military execution to be done upon them, after it was proved

that they had formed part of the rebel army. They had contrived to hide themselves, and got to the Galloway coast, nearest to the Isle of Man, where they were skulking in hopes of some smuggler, or foreign vessel, enabling them to escape. As they were just about to be led out to execution, Mr Goldie observed one young man, of superior and interesting appearance, attempting to tear a written paper, when he immediately called out to an officer who guarded him: 'Seize that paper;' which was immediately done. Upon reading it, Mr Goldie said: 'Why, young man, you were attempting to destroy yourself. This paper is your commission from the king of France as an officer in his army; and I now detain you as a prisoner of war, instead of sending you off to be shot as a rebel.'

"The young man was accordingly put in a place of confinement, and not a very severe one, considering what prisons then were, as he afterwards related that his chief occupation consisted in counting the large square stones with which his apartment was flagged, in every possible direction, and thus trying what their number could be raised to. But he did not continue long thus employed. A rumour speedily arose in the town that this was the long-lost heir of the House of Orchardton, an old Roman Catholic family. An old female domestic, hearing the surmises, made her way to his place of confinement, when a little conversation left no doubt that he was indeed the only son of the late Sir Robert Maxwell, who had sent him at an early age to the college of Douay, the usual place of education at that time for young men of family or fortune of the Catholic religion. Sir Robert himself being superannuated, his brother, who then took the management of him and his son and estate, wrote desiring that he should be educated for the priesthood. The young man, not relishing this destiny, made his escape from college, and enlisted in the army of Louis XV., and was one of that part of it which was sent to Scotland to assist in the enterprise of Prince Charles Edward. Young Maxwell had thus actually been taken wandering as an outcast, and in danger of forfeiting his life, on the confines of his own estate, unconscious of his rights, while his uncle was equally unconscious of the danger to his unjust possession, which lurked so near him. The whole of the facts were, however, so recent, and could be so easily proved, that Mr Goldie immediately proceeded to take all necessary steps for the security of the young Sir Robert, and also to put him in possession of his estate, when the death of the uncle removing the formidable obstacle, the usual legal formalities, after proving the identity of the heir, put him in possession of his father's fortune and title. Sir Robert soon married Miss McClellan, a niece or near relation of the last Lord Kirkcubright, and took up his residence at Orchardton, where he continued, while he lived, the ornament and delight of the country, uniting all the gentlemanly dignity of the old school with the bland and graceful gaiety of foreign manners. The intimacy which arose between Sir Robert and Mr Goldie and his family through this romantic beginning, was long continued on very affectionate terms." Sir Robert being a partner in the Ayr or Douglas and Heron Bank, lost a large portion of his estate when that bank stopped payment. He died suddenly in

September 1786, whilst on the road to visit the Earl of Selkirk.'

Readers who are interested in the above remarkable legend, may perhaps find some additional particulars in Miss Goldie's *Family Recollections*. The chief incident referred to would at any rate form a better theme on which to found a romantic fiction than the miserable inventions drawn from the unwholesome imagination of many modern novelists.

THE MONTH:

SCIENCE AND ARTS.

PROFESSOR HUXLEY, during his recent visit to America, delivered an address at the new university in Baltimore which has been founded by the munificence of a private citizen, who bequeathed seven million dollars—one half for education, the other for an hospital. If Baltimore does not find itself possessed of one of the very best educating institutions in the world, it will not be through want of knowledge, for Professor Huxley shewed clearly what elementary education ought to be, and the way in which it should be directed and intensified by the higher education of the university. Art, science, history, and philosophy are included in the scheme, whereby opportunity is offered for practical investigation, for abstract thought, for development of the 'rare faculty of æsthetic representation, and the still rarer powers of creative genius.' Professor Huxley takes a high view of the medical profession, and his exposition of the training which a student for that profession should undergo, and of his subjects of study, would, if put into practice, increase the usefulness, and raise the character of the profession to high distinction. Apart from its practical value, the discourse is well worth reading, as an earnest and eloquent review of an old and much debated question, and we commend it to all who are interested in the important work of education. The promoters of the new Cavendish College at Cambridge, and the new military college near Oxford, should take it into consideration while planning their respective courses of study.

The Royal Society have published in a number of their *Proceedings* an account of the cruise of the *Valorous* in so far as relates to the physics and natural history of that portion of the North Atlantic traversed by the vessel. As some of our readers will remember, the *Valorous* accompanied the exploring ships *Alert* and *Discovery* as a store-ship; and it was on her return voyage from Disco that the observations now published were made. The 'biological results' are described by Mr Gwyn Jeffreys; and Dr Carpenter, whose son made the 'physical investigations'—chiefly on currents and temperature—contributes a Report which adds somewhat to the theory of oceanic circulation.

This expedition has been, so to speak, supplemented by foreign enterprise, for the Storting—the parliament of Norway—voted a sum sufficient to defray the cost of a series of surveys, and in the

summer of the present year the ship *Voringen* was sent out to explore from the Faroe Islands to Greenland, and from the Norwegian coast to Jan Mayen and Spitzbergen. This scheme, as will be understood, includes large parts of the North Atlantic not touched by the *Valorous*, and thus our knowledge of the animal life, of the contour of the bottom, of temperature and currents from the surface downwards, and of the chemical constitution of the water, has been much extended. And incidentally it was discovered that the banks off the coast of Norway were of a breadth quite unexpected, reaching to a hundred miles from the land. Beyond this limit the water is icy cold; but on the bank it is comparatively warm, which perhaps accounts for the mild climate of those latitudes in winter. The deepest sounding obtained during the cruise was eighteen hundred fathoms, midway between Norway and Iceland. Reports of the scientific results will be published, and in this way the Norwegian government acknowledges a debt of gratitude for the advantages which their mercantile marine has derived from the nautical surveys of other countries.

Mr Roberts, F.R.S., chemist of the Mint, has given a lecture on the apparatus with which the late Professor Graham made his researches, and therein we find a fresh example that genius of the right sort can work with the very simplest means. Wollaston and Faraday are cases in point; and now Mr Roberts tells us that 'with a glass tube and plug of plaster of Paris, Mr Graham discovered and verified the law of diffusion of gases. With a tobacco-pipe he proved indisputably that air is a mechanical mixture of its constituent gases. With a tambourine and a basin of water he divided bodies into crystalloids and colloids; and obtained rock crystal and red oxide of iron soluble in water. With a child's india-rubber balloon filled with carbonic acid he separated oxygen from atmospheric air, and established points the importance of which, from a physiological point of view, it is impossible to overrate. And finally, by the expansion of a palladium wire, he did much to prove that hydrogen is a white metal.'

A man of this stamp should be held in lasting remembrance. We are glad to see that Professor Graham's scientific papers have been collected and published for private distribution under the editorship of Dr Angus Smith.

Mr Lehmann has made experiments with a view to determine the form of nitrogen most suitable for the nutrition of plants; whether as nitric acid or as ammonia. Curious results were shown. Some of the nitric acid plants which turned pale and sickly after a few days, were recovered by placing them in the ammonia solution. In experiments with tobacco-plants, it was found that the nitric acid plants produced three times as much dried substance as plants grown without nitrogen, and the ammonia plants six times as much: an important fact as regards tobacco. But the yellow lupine appears to be the most remarkable, for

though in itself rich in nitrogen, it will grow in soil containing scarcely any nitrogen; and we are told that it is found in abundance in districts generally barren.

We mentioned some time ago that experiments had been made by authority of the Royal Agricultural Society to determine the value of 'unexhausted improvements' on farms, to test the merits of artificial manures, of plants and seeds, and methods of cultivation. These experiments are to be continued in a systematic manner, for the Duke of Bedford has allotted a farm at Woburn to the Council of the Society, and has offered to defray the cost of such buildings as may be required, and of the experiments also. Under these favourable circumstances we may hope that many unsettled questions in agriculture will be carried to a satisfactory solution.

'On the Moon's Influence in Connection with Extremes of Temperature' is the title of a paper read to the Meteorological Society. The author, Mr Drumham, believes he has made out the fact that there is 'some important connection between lunar influences and extremes of atmospheric temperature upon the earth; but that this influence is partial, and very materially affected and modified by the circumstances and conditions of place, and that the careful and patient inquiry of *how* and *why* the weather of different localities is differently influenced by the movements of the moon, is one of the offices which meteorological science has at this time to perform.'

Mr Drumham points out that very severe winters have occurred at intervals of about sixty-two years, which correspond to periods of double the moon's cyclical return to relations with the earth and sun. Starting with 1709, he shews that the intervening dates support his theory; 'and as there was a very severe winter in 1814,' so, he concludes, 'there will be one in 1876.'

Rainfall is such an important element in regard to agriculture, sanitary measures, and engineering works, that it is encouraging to learn, from Mr G. J. Symons, the best authority on the subject, that in consequence of the number of rain-gauges now established (about two thousand) throughout the kingdom, we have a system of observation such as no other country can shew. It is hardly possible, he says, to find a district within the British Isles which is more than five miles from a rain-gauge. Considering the importance of the subject, it is suggested that an inspector should be appointed to visit all the stations, see that they are kept in order, and draw up proper reports; and that as the nation at large are interested in it, some moderate grant from the national funds should be made for carrying on the observations and publishing their results.

A very important question among all navigators is the speed at which a ship steams or sails. The log at present in use has a rotating helix, which spins round when the instrument is towed in the water; the rotations record themselves on an

indicator, and thereby shew the speed at which the vessel is moving. But this log, though ingeniously contrived, is not sufficiently accurate, and many attempts to improve it have been made, and at length what seems like the right way has come to light. This new log is fitted with electrical apparatus, besides the rotating helix, and is towed by an electric rope. The indications pass along this rope, and are shewn on a dial-plate in the captain's cabin, or any other part of the ship. The rate of sailing is thus made known instantaneously, and with an approach to accuracy never before attained; and as we are informed, the rate of flow of streams and currents can be ascertained by the same instrument.

At Portsmouth, trial has been made of a ship's boat which, as is said, cannot sink even when full of water. A band of cork is fixed outside from end to end, just below the gunwale, which gives the requisite buoyancy, and then, by means of valves, the water inside can be reduced to the level of the water outside.—A boat by which horses or guns may be landed has been tried at Deptford dockyard. It has no keel; the bottom is rounded up at each end, and thus facilitates near approach to the shore; and the stern is a hinged flap, which, 'when drawn up and secured, forms a water-tight port, and when lowered, constitutes a platform between boat and shore, over which horses or guns may be embarked or landed.'

The seasoning of wood by artificial means seems to be a perennial question, for the old and effectual process of seasoning by long exposure to the air—in common with the old process of tanning—is too slow for the rapid spirit of the present day. Some inventors have sucked all the moisture out of timber by powerful machinery, others have boiled it out, and others have tried to force it out by forcing something else in. But none of these methods has proved satisfactory. Another is now put forward by Gardner & Son of Glasgow, who state that they dissolve the sap, extract it completely from the wood, and fill the place it occupied with a preservative substance 'in a very simple manner.' Their theory is, that they not only deprive the wood of its tendency to decay, but that they impart strength and density to the fibre, and render it non-inflammable, whatever may be the kind of wood or the purpose to which it is to be applied. Builders and constructors all over the world will rejoice at a demonstration that wood is no longer liable to dry-rot nor to fire.

Steel when long exposed to wear and tear is altered in structure, becomes crystallised and brittle. When in this condition, as has been proved by experiment, its strength and toughness can be restored by making the steel red hot and plunging it into cold water. Proper precautions are to be taken that the outside shall not cool much quicker than the inside, and then it will be found that the metal will bear a greater strain than before. What an opportunity is here afforded for restoring the strength of engine shafts, of axles and tires, to say nothing of the steel that enters so largely into machinery and constructive works generally.

Cannons of enormous size seem to be on the increase. Some time ago we made one of one hundred tons for the Italian government, and now we read of an order being contemplated for a gun of considerably larger dimensions—probably one

hundred and sixty tons. Where is this rage for colossal ordnance to stop!

A congress of Orientalists at St Petersburg, a congress of jurists and scholars on international law at Bremen, a geographical congress and a hygienic congress at Brussels, all within the last three months, may be taken as a sign of the times, and as evidence of a growing desire to find out true principles, and the best way of reducing them to practice. In the hygienic gathering much was said on the organisation of medical service for the field of battle, and it was shewn that much advantage would accrue if every soldier carried with him some simple surgical apparatus. 'Already,' said the speaker, Dr Appia of Geneva, 'the Germans have learned to take with them into action a little Esmarch bandage, and the French a morsel of lint.'

In a discussion on quarantine, Mr Hirsch contended that quarantine does not prevent the breaking out of epidemics. He had studied cholera on the Vistula, and found that the disease did not spread even in the absence of quarantine, and disappeared on the adoption of proper hygienic measures.

On the question of workmen's dwellings, Mr Jacquemyn of Ghent pointed out that it 'is not of unmixed benefit to the workman to be tied to one spot. Trade ebbs and flows, and a man may be left stranded in his cottage while the tide of business flows elsewhere. Moreover, workmen ought to be subject to the refining influences of a class above them. Their houses ought not to be placed together in one part of a city, for in that case the workmen's town might become a danger to the greater town in which it is built.'

Professor Esmarch of Kiel, whose name is above mentioned, ranks among the foremost surgeons of Europe. He stated recently, in addressing a meeting of German surgeons, that he regarded Lister's antiseptic treatment of wounds (which has been noticed in this *Journal*) as one of the most interesting surgical topics of the day. And speaking of operations on the battlefield, he said that they should be confined to the removal of limbs totally shattered by shell or cannon-ball; that almost all wounds of the extremities from rifle-balls permit of recovery under antiseptic dressings, whether the bones are injured or not. But if wounds are to heal without contamination they should not be touched by the surgeon's finger. The number of antiseptic remedies is increased, for bran, properly mixed with carbolic acid, is found beneficial as a dressing in cases of compound fracture of the bones: it limits suppuration, disinfects the discharge, and is 'germ' proof. And soft cotton wadding coated with tannin has been tried in Germany with marked success, particularly in injuries occasioned by machinery: it prevents inflammation, arrests capillary bleeding, and promotes the healing process.

As is pretty well known, the women of this country who wish to qualify themselves for the practice of medicine are placed at a disadvantage when compared with the women of the United States, who are at liberty to pursue the necessary studies in a college, to enter for examinations, and compete for the degree of Doctor of Medicine. But there is prospect of a change; for it is announced that the College of Physicians of Dublin are prepared to open their doors to women, and to

grant them a license if found qualified. Without offering any opinion on the subject of 'lady doctors,' we may infer that when so eminent a corporation as that of the Dublin physicians set the example just alluded to, we may conclude that it will ere long be followed in other parts of the kingdom.

America has taken the lead in many praiseworthy reforms: among the latest is the 'American Free Dress League,' which recently held meetings in Philadelphia. We are informed that 'they desire to abolish all unhealthy and cumbrous forms of female clothing, and to substitute styles which agree with the natural laws of hygiene.' Some of the ladies were clothed in the new style, which is described as 'loose-fitting trousers and sack.'

The return of the *Alert* and *Discovery* at the end of October from their exploration of the Polar Sea was a surprise. Sanguine geographers at first felt disappointed that the ships had not reached the Pole, but were consoled by the fact that but few lives had been lost, and that lands heretofore unknown had been discovered. Physicists and naturalists are hopeful that the observations of natural phenomena, the pendulum experiments, the collections of animals, plants, and fossils, will largely increase our knowledge of magnetism and meteorology, of the figure of the earth, and of the fauna and flora of the arctic regions. These collections, in addition to the enormous crop brought home by the *Challenger*, will, in the describing and classifying, furnish to our working naturalists some years of employment.

The highest latitude reached was $83^{\circ} 20' 26''$ N.; hence among all adventurers Englishmen may now claim to have been the nearest to the Pole. In 1827, Sir Edward Parry, on the Spitzbergen route, after strenuous endeavours to drag his boats during thirty-five days, was compelled to give up in $82^{\circ} 45'$. At this, their ultimate halting-place, a sounding of five hundred fathoms failed to reach the bottom; but the present party struck the bottom at seventy-two fathoms. From this remote spot, about four hundred miles from the Pole, no land could be seen in the north—nothing but ice of the most rugged and distorted description, over which it was not possible to travel more than a mile a day. So ends the speculation of an open Polar Sea. Instead of the rolling waves which Wrangell saw in 1823, the enterprising explorers of the *Alert* and *Discovery* saw ice eighty feet thick stretching away beyond the reach of vision.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.

3d. All MSS. should bear the author's full CHRISTIAN name, surname, and address, legibly written.

4th. MS. should be written on one side of the leaf only.

5th. Poetical offerings should be accompanied by an envelope, stamped and directed.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

SINGING ROUND THE WORLD.

To go on a musical excursion round the world—warbling the charming lyrics of Ramsay, Burns, and the later Scottish poets—in all places in every English-speaking country received with hospitality and heart-felt applause—and returning after four years with satisfactory results, seems to us a very delightful way of spending one's time. We at anyrate cannot picture to ourselves a line of life more pleasant. It is gratifying even to know that there are persons qualified to exercise vocal powers in a manner so universally acceptable. The public singing of songs and ballads has become almost a lost art. The stage has no longer an Incedon or Brahan. Sinclair, Wilson, Templeton, have passed away. Some of the finest pieces in the English drama can no longer be represented, simply because there is no one who can sing, or is willing to sing, in the popular style that pleased our ancestors.

In this general dearth of vocalism, there casts up a family which fulfils at least the required condition of being able to sing the Scottish songs much in the style of Wilson and Templeton—not actors, nor with any pretensions to the histrionic art, but vocalists possessing a tact and taste, and a degree of literary talent qualified to afford an evening's innocent amusement; the whole, father, sons, and daughters lending a hand in the performance. The group is somewhat interesting. We chanced to light upon the father, David Kennedy, about twenty years ago, at a very obscure place of public entertainment, and thinking there was the right stuff in him, we counselled the trial of his wings in a more pretentious atmosphere by singing, with illustrations, the songs in Ramsay's 'Gentle Shepherd'—wonderfully fine lyrics that in a popular way had dropped out of notice. The thing took. In a single night Kennedy made his name as a Scottish vocalist; and so on he has gone ever since, fortified with the assistance of his family. Like a flock of nightingales, they go piping their way from country to country, everywhere stirring up kindly recollections of home

and its lyrical associations. Having just returned from a prolonged excursion, which included Australia, New Zealand, California, and Canada, David, one of the sons, has given an account of this remarkable family expedition, of which we propose to take some little notice. The book might have been improved in style by leaving out a variety of colloquialisms, but taking it as it stands it offers some graphic notices of the places visited, and of the adventures that were encountered.

The father, mother, three brothers, two sisters, and 'Cousin Tom' as business agent, sailed from the Clyde in June 1872, and without adventure arrived safely at Melbourne. Here was a stay of three months, with a successful course of singing. There were numbers of Scotch in Melbourne, who came to hear the old melodies of their native country. We can hardly fancy the passion with which these colonists of all classes will go miles and miles to listen to such songs as 'John Anderson my Jo,' 'My Nannie O,' or 'Lochaber no more.' For the time being they are in a transport of delight. Besides enjoying crowded houses, the Kennedies were charmed with the weather. The season was called winter, but it 'was genial and bracing, and never very cold, with a sky generally cloudless and transparent. There was a sunny sparkle in the air that proved in the highest degree exhilarating. One seemed to be breathing brilliance—inhaling aerial champagne.'

After Melbourne, the next towns visited were Ballarat, Geelong, and some others, the varied journey being performed partly by railway and partly by stage-coaches. With a view to a more independent system of travelling the family bought an American wagon, with a square-built body and a glazed leather roof, the body being hung upon layers of leather belts, to accommodate the plunging and jolting over rough roads. Horses were also purchased, and an Irishman hired as driver. To this turn-out was shortly afterwards added a buggy, sufficient to accommodate two persons, and which was appropriated by two elder members of the family. With these vehicular accommodations a long round was performed to out-of-the-way

places, and then there was a short return to Melbourne. Next, a fresh start, and a wild journey to visit remote places, to which there was no other road than diverging tracks through the Bush, which had often to be taken at random. In their visits to Melbourne and other towns, the Kennedies had often occasion to come across 'Torturations' exiled from England, who, after all sorts of shifts, were driving bullock-wagons or street cabs, in which last capacity they excelled, perhaps from their horsey proclivities in the old country. When sunk to an abject condition, and when they do not in despair drown themselves in the Yarra-yarra, as is too often the case, these hapless specimens of Torturations take to begging under the name of 'swagmen.' The loneliness in travelling through the Bush was sometimes relieved by the appearance of a swagman on the horizon. 'The swagman or tramp is a kind of demoralised gabberlunzie, who trudges about from squatter to squatter and from township to township, begging food or assistance on his journey; which journey is endless, and continues from year's end to year's end. The professional swagman walks to live. One species of tramp is the "sundowner," so called from his habit of appearing at a squatting station about sunset, and asking food and shelter for the night. The generous "open-door" hospitality of the early days, which has latterly been abused, is fast disappearing from amongst the squatters, and instead of his usual cold mutton, the swagman now gets the cold-shoulder. Sometimes the tramps accept work once a year, about shearing-time, at one or other of the sheep-stations, or seek occupation in a country town; but as a rule they are migratory and lazy. An uninitiated person is very apt to confound the swagman with the foot-passenger or unemployed mechanic travelling in search of work, their equipment being the same—a "swag," or strapped-up bundle of sleeping-blankets, slung over the shoulder; a "billy," or tin can, in which to make tea or coffee while camping; and a small "pannikin" to drink water out of at any creek or spring. Now and then you see sailors and ship-stewards "swagging it" through the Bush, runaways from some lately landed vessel; but the eye at once detects them as amateurs; they have not the swing of the professional loafer.'

Arriving at a small village called Branhholme, it was resolved to give a concert. For this purpose, a wooden schoolhouse was secured, a public announcement given, and the pianoforte, which the party contrived to carry with them, properly adjusted. How any kind of piano should have been lugged about in these excursions seems scarcely practicable. We are told it was a square little instrument, four octaves and a half, made by special order in London. It stood upon three legs, which being screwed off, the instrument was packed in a canvas cover with two leather handles. When off duty, it was strapped to the back of the coach, and ready at all times for use. Never

was there such a serviceable piano, or one which kept better in tune. The evening concert at Branhholme was well attended by persons from all directions. The scene was a little grotesque. While the audience were seated on school-desks and forms, the Kennedies had to sing on a platform composed of a brandy-box covered with a table-cloth. 'The lighting consisted of our two coach-lamps, one at each end of the "stage," supplemented by one or two candles stuck in bottles, which we asked the front-seat people kindly to hold in their hands.' When the place was crammed, some half-dozen people rushed in and took possession of a capacious fireplace, and the overplus of outsiders looked in at numberless holes and broken windows. It was altogether a success—a triumph to the attractions of song endeared by early associations.

At a place called Dunolly, the party came across the locust plague, which had been devastating Victoria for several months. It was an awful affliction. The village shopkeepers had in terror put up their shutters and temporarily retired from business. 'Clothing hung out to dry was subsequently found to be pierced and riddled, window-blinds even not escaping. It seemed like a heavy snow-storm, each flake animated, fluttering, and whirling. The sky was laden with wings. Every step you took startled fresh clouds of the insects. They were about an inch and a half in length, somewhat like a grasshopper, and armed with two large, powerful, propelling saw-legs. The insects when we saw them were pursuing a southerly course, and many were the schemes put forward to get rid of them—some advocating the introduction of certain well-known locust-birds, others purposing to dig trenches and build long lines of fires, as the most effectual means of riddance. The locusts, by the way, did not hear the conclusion of the argument, as they went steadily forward, and landed in the sea near Geelong.'

It was considered a daring thing for the Kennedies to attempt an overland journey from Melbourne to Sydney; but nothing daunted, they set out on this expedition in March 1873. On being twenty-three days out, they crossed the Murray, and gave a cheer as they passed into New South Wales. There were some droll adventures on the road. Here is a specimen of the way they lived. 'We make a start as usual in the early morning; all the forenoon we wind monotonously through endless sheep-runs, with no companions but the tuneful magpies and occasional clusters of sheep. At mid-day we pull up at a creek and camp for a couple of hours. We unharness the horses, and tie them to the trees round about us—then one of us runs down to the creek to fetch water; another spreads a white cloth on a sloping bank; and a third scrapes together chips, twigs, pieces of bark, and miscellaneous tinder, making a blazing fire against a tree-stump. By this time the supplies are out of the coach—a cosmopolitan diet of canned meats—sardines from Paris, herring from

Aberdeen, oysters from Baltimore, and currant-jelly from Hobart Town, Tasmania. While we are occupied with these, the "billy" is bubbling on the fire, and another large can is simmering with potatoes. The horses are busy crunching their maize; our driver is belding up the fire with logs, and fanning it with his old slouched hat. He makes us some capital tea, which we enjoy with the hot potatoes. Then we stretch ourselves out in the shade, and enjoy a short dreamy siesta, for the day is warm. In half an hour we are up and bustling about, folding our table-cloth, collecting our tin pannikins, hooking our pail and billies to the back of the coach, collecting the horse-feed, and harnessing the horses. We are careful, too, to put out the fire—there is a heavy fine inflicted on any one who leaves anything burning in the Bush. The grass is dry, and a spark sometimes will set it ablaze. A brief look round to see that nothing is left, and we are off.

Sydney is at length reached, and its buildings, parks, and harbour are described with a glow of admiration. There is apparently only a single drawback—the annoyance arising from the mischievous pranks of a class of untamable youths, called "larrikins," who go about in gangs of twenty or thirty, break street-lamps, maltreat policemen, tear down fences, hustle respectable people even at noonday, and at night commit assaults and robbery. The larrikins have become a deep social nuisance; but surely it is within the compass of law and government to deal vigorously with this intolerable evil. From Sydney the Kennedies sailed to Brisbane, the capital of Queensland, a distance of five hundred miles. Here, in this modern and thriving city, where Scotchmen are very numerous, they were received with much kindness both in public and private. They sung in the School of Arts, which has a fine capacious hall, adjoining which is an excellent library and reading-room. The sight of large public libraries and reading-rooms at the principal cities in Australia, struck the party with delighted surprise. There, at the other end of the world are seen tables covered with the freshest newspapers, magazines, and reviews from the old country, and looking around you can scarcely realise the fact of being many thousands of miles from home.

Still possessing the coach and team of horses which were shipped with them from Sydney, the party set out on a journey to Gympie, a distant town which had sprung into existence near some gold-diggings. Towns of this class have three stages: they are at first canvas, then wood, and lastly brick. Gympie was as yet in the wooden stage. This was the most toilsome journey yet encountered. The roads, where there were any, were bad, the hills were steep, and everything was in a raw state. A passage in many places had to be cut through the dense scrub. The first night, accommodation was found at a wayside inn, kept by a Perth woman, who did her best to make the family comfortable. Next night, things were at a bad pass. Near the top of a terrible ascent, the coach fairly stuck. It was seven weary miles to Cobb's Camp, a wayside house. As an only resource, the horses were unharnessed, and led off by the party towards this haven of rest, Patrick the driver being left in the coach for the night. Next morning, by means of a relay of fresh horses, the coach was brought forward. In the afternoon

about four o'clock, Gympie was sighted, and never was town so welcome. "We were covered with mud from head to foot, and as we walked up the main street, a rumour spread that we had arrived too late for the concert. But we set to work, had tea, put the hall in order, and at eight o'clock stepped on the platform." One reads of this with satisfaction. It shewed a determination not to be baffled. Maryborough, Rockhampton, and some other towns, were visited, and sung to. Temptations were held out to go to the more northern parts of Australia; but the party declined the invitation, and wended their way southwards towards Sydney.

Experiences at some of the wayside hotels of Queensland were far from agreeable. "Three of us are quartered in one bedroom, and accommodated with what are called "swagmen's beds." The pillows are stuffed with straw, and the wisp stick into our ears. We sleep under the national tricolour—red, white, and blue—a rough red-threaded coverlet, a thin blue blanket, and a thinner white sheet. Another sheet separates us from the barred trestle beneath, and we feel as if sleeping along a ladder. One window serves two rooms, the partition coming right in the middle of it. As the window is open, and a breeze blowing, we try to shut it, but find the gentleman next door has propped it up with the hair-brush. The wall on one side is a wainscoted partition, and a cat-ract of rats and mice pours unceasingly through it. The other is the usual calico screen, and when we blow out our candle we are startled by seeing, in gigantic shadow-pantomime, the whole of our neighbour's nocturnal toilet. Just as we are dozing off, we hear angry voices in the bar—a crashing of glasses, a scuffling of feet, yells, blows, and foul language—recrimination, threats, and female onerics for the police. Suddenly the sounds mellow down, and we know the combatants have been bundled into the open air. Lightly dressing ourselves, we hurry out." There ensues a horrible drunken brawl not to be described.

On some occasions, there arose difficulties in preserving silence and order at the concerts. A rule was laid down that none should enter while a song was singing. This reasonable obligation occasionally gave serious offence, even in the case of ladies who should have known better. There was also the common rule: "Children in arms not admitted." But what could poor people do with their children? "Very often the fond mother would place her infant against the wall, saying: "Ye see the puir thing can stand!" and again it was no uncommon thing to see a father and mother dragging a suckling between them, almost dislocating its arms, till they got it past the door. In large towns this rule acted well enough; but in the wide-settled country districts, where our concerts were advertised as much by rumour as by bills, people in ignorance of the "stern law" came long distances with children in arms. Then it was that our materfamilias had a pleasant duty to perform; for my mother, taking compassion on her country-women anxious to hear a "Scotch sang," looked after their babes in an adjoining room during the concert. Very often she had three or four of these valuable charges at once, the mothers coming out during the "Interval of Ten Minutes" to pet the infants, or give them their natural nourishment."

At Bathurst, the Kennedies sold their vehicles and horses, and went by rail to Goulburn, a distance of two hundred and fifty miles. At a small seaport, they sailed in a vessel for Sydney, from which they proceeded in a steam-boat to Hobart Town, in Tasmania. We have a short but good account of the island, and its decent orderly inhabitants. As regards the people of Hobart Town, we are told they are in a marked degree homely and hospitable, and during their stay the party met with much private friendship. 'It was our happy privilege to meet an excellent lady, the grand-daughter of Niel Gow, and daughter of Nathaniel Gow, the composer of "Guller Herrin." We enjoyed the kindly hospitality of herself and her pleasant family. They were very musical. The good lady is a talented teacher of music, and her two sons are organists in the city. At her house we spent Christmas Eve and the last night of the year. . . . The people of Hobart Town support a fine choral society. In their appreciation of the songs of Scotland they were not behind any other portion of the antipodes, and the success we met with was continued throughout the island.' At Launceston, the Kennedies gave their farewell concert, concluding an elaborate performance with 'God Save the Queen,' sung in parts to an enthusiastic audience. The last of Tasmania, on sailing across the straits to Melbourne, was seen in magnificent weather. Only one excursion in Australia remained. It was to visit Adelaide. Here, fortune did not desert the party. They travelled for a month, singing their way through sixteen towns, everywhere drawing good houses, everywhere eating lots of delicious grapes, everywhere cheered with rounds of applause, and everywhere noting with gratification the wonderful progress making in the fortunately prosperous colony of South Australia.

The next move of the party was to New Zealand; but how they got on there and elsewhere in their singing excursion round the world must be left to another paper.

W. C.

THE ARAB WIFE.

A TALE OF THE POLYNESIAN SEAS.

CHAPTER VIII.—STRATAGEM.

My time was now pretty well taken up. All day I worked away with the Papnans (who proved to be exceedingly skilful boat-builders) at the pirogue, and at nightfall I passed delightful hours with Fatima. I taught her English in part, and the principles of Christianity, which she accepted with eagerness, and vowed to follow. Day by day the necessity of cloping grew more clear, as Nizam would never give me his daughter unless I became a Mussulman, which, since I had known Fatima, I was firmly resolved against. In fact I had about made up my mind to steal the pirogue when finished, make off with what I possessed and my darling girl, and make a dash for Australia. There were charts and maps in *The Shark's* cabins, and when Nizam came back, I could get them on some pretext. The pirogue when finished would require very few hands to sail it, and I could easily get Papuans to accompany me without much scruple; all I had to do was to hurry, to continually hurry, the workmen.

Monssoul and Abdallah started with the proas along with Tamnia, the head chief of the Malays; and then work had to be slackened a trifle, for the best men were gone; and pursuant to Nizam's instructions, one of us, either Abou or myself, had to make rounds, in a friendly unconcerned way, among the men who were left, and take charge of the castle. This was not so bad, as, by the chief's order, Abou and I took our meals in the little room where the chief usually sat, and I knew that bright eyes were peeping at me through the screen, and a warm heart was beating responsive to mine. But I agreed with Fatima that she should never, by word, look, or token, in any way allow any one to guess at our intimacy and our meetings. Old Abou, good old soul! often spoke to me of being absent-minded, and thought that my mind was dwelling on my own people. On these occasions he would dilate on the happiness of the Arabs, and how they were the masters everywhere on land and sea. I listened to him with pleasure, but the anxiety told upon my spirits, and I grew thin and pale. It was not for myself I feared, but for one now dearer to me than existence, and I could not but understand how dangerous discovery would be for her as well as for me; for though our attachment was most innocent, and I solemnly regarded her in the light of one who was pledged to be my wife, yet I understood by this time the Arab nature perfectly well, and knew that it would be Mohammedanism or death.

We had, by the time the proas returned, completely finished the pirogue, save the steering apparatus. Monssoul had kept his word partly; he brought a wheel, but no capstan, which, however, we contrived to do without. We went to work vigorously, now having more time and better assistance, and in another week had her completely rigged. Nizam had now been gone many weeks, and we became anxious for his reappearance; and Abou held a grand consultation with myself and the other two head Arabs. Various things were suggested; but Abdallah at last hit upon the truth—namely, that Nizam was enlisting more men than he intended, picking them up in small parties in the towns along the Arab coast. Monssoul warned us to be on our guard. The Malays were in bad temper, for the prize they had taken had been laden with tea. A great many had been killed, and the vessel, which was French, would have beaten them off, but for the personal bravery of Abdallah and the few Arabs who were with him. It now behoved us, as the friends and confidants of Nizam, to watch and see that the Malays did not storm his castle, which they believed was full of treasure. They had been whispering among themselves that *The Shark* contained huge treasures, which Nizam had kept for himself, and that he had sailed away never to return.

This was bad news, and I saw Abou look very grave. It was plain that it was false, since it was known that the females of his household were in the castle; and had he abandoned us, they would have gone with him. He would also have taken his best Arabs; whereas he had taken good fighters indeed, but had left those in whom he had the greatest confidence. 'Look here,' said I, 'good

friends—for we are all good friends, are we not! friends of our absent chief, and friends of each other. This is what I propose: We will go all of us separately among the Malays complimenting them, and saying that we have always had luck when Nizam is gone. And we will make them all small presents. And I will propose to Tamula to make him a pirogue like this one of Abou's, that's nearly finished. We launch her to-morrow, and we will take him and the other chiefs, and have a feast.'

'Good, good!' cried Abou. 'I told you always that this boy was a well of wisdom.'

'That's not all, Abou. We will have races.'

'Why, we have no horses.'

'I don't care for that. We will have a race of proas, with presents for the chief; and we will enter with the pirogue, and have prizes, first and second. Tamula is sure to be slow, but we will let him win. Then we'll have races for Malays and Arabs only in swimming, and give a handsome prize; and a race for sampans for the Papuans, and give one of the barrels of palm-oil. Then they'll think so much about the races that they will forget to manœuvre against us until Nizam comes home; and there will then be so many of us that we can eat them, if it wasn't against the Prophet's law to eat the flesh of swine.'

I never saw men so tickled by a poor joke. Abdallah seized my hand and nearly crushed it in his grasp. He was a tall fellow, with gigantic proportions, and as brave as a lion. Old Moussoul agreed to give the prizes from the chief's store, and to get from the household, through the female servants, a rich shawl for the first prize, and gold bangles for the second for the proas. For the swimming prize the object chosen was a matchlock; and for the Papuans a barrel of palm-oil.

We got up from the conference with great cheerfulness, and Abou went to look after the launch. Moussoul went up to the castle; and Abdallah and I started to pay a visit of ceremony to Tamula. He received us graciously enough; and we told him of our intentions, and asked his assent, as he was nominally our superior during Nizam's absence, though in reality the Arabs were quite independent. He caught at the idea eagerly—for the Malays are frightful gamblers and immediately offered a heavy bet that his proa would beat us all.

Abdallah said: 'The Feringhi's proa is completed and being launched, and he means to enter it too.'

'Let him, let him,' he cried; 'all the better. Will you take my bet?'

I answered: 'Yes, sahib, I will; but you must let me use sail.'

'Use sail, our, everything; I will use the same. Is the vessel launched?'

'No, sahib,' I answered; 'but it is just about to be launched.'

'We will go and see it,' Tamula cried, jumping up, and immediately making long strides for the beach.

We got there in a very few minutes, for the Malay town is close to the shore; but Abou was too quick for us, and the pirogue was afloat in the water. Her appearance in the water was charming. She seemed to nestle down in the sea as if it was her natural element; and I felt sure she would make a good sailer. There was a light breeze stirring, and so jumping into a sampan, I was soon on

board of her. Abdallah, Tamula, and one or two Malays followed; and we soon had the lug-sails and fore-sail set and were gliding across the harbour in fine style. The wind was south-west, and we sailed about to our hearts' satisfaction, making better time than even I anticipated. We seemed to glide through the water; and I shewed Abou that we left no wake at all to speak of, whereas the proas leave a wake as broad as a mill-stream. Abou was delighted. I too was delighted, and even Tamula seemed pleased.

'Feringhi,' said he, 'I won't bet if you use sails. My bargain is only on condition that you use no sails in the race.'

To this I agreed, and said that we would require four days to get the pirogue ready for the race, because we had to arrange benches for the rowers in the grooves, and to make ready oars or 'sweeps' large enough.

Tamula assented, and we went below in high good-humour. It proved rather too hot there, so we had our meal on deck, and sat in the shadow of a sail enjoying ourselves hugely. Tamula seemed certain that he could beat us; and I thought he could too; but the pirogue was wonderfully light and buoyant, and with four men at a sweep, I thought we could shew them something. The next point was to make the Papuans sing. They are regular darkies; and dear old Captain Orde used to say that without a song a nigger couldn't pull against a fly; with it, he could haul against a rhinoceros. So whilst Abou was arranging the oars, I got a lot of Papuans, and began to teach them a medley. I could not for the life of me remember the words, but the chorus went: 'Hilo boys, hilo-lo!' The rest of it is unimportant, and can be supplied with any gibberish; so I filled in with Papuan, and taught them to pull strong and slow to the words 'Hilo boys, hilo-lo!' There is instinctive time and melody in the poor fellows' composition, and they took to it wonderfully kindly. We pulled away at this slow and steady, and then I taught them another which had a chorus of 'Walk away.' This was much faster, and I soon got them to pull tremendously.

But this took some time, and I had twice to get the head chief Tamula to extend the race fixture, until by this procrastination ten days of the time had passed by, and we expected Nizam would arrive every day.

Still he did not make his appearance, and the day of the race came. Moussoul had got ready the prize of a shawl and gold bangles from the women, and their curiosity was intensely aroused to see so novel a spectacle. It is a fact that there was not a soul there had ever seen a race before of any description, and they were enthusiastic about it; so, to oblige them, Nizam's proa was withdrawn from the race, and conveyed the ladies closely veiled to the turn in the harbour where each proa had to come. In fact, it became a kind of stake-boat, which the others had to round.

The first race was the swimming, mile out and mile in, which was won by a young Malay, one of our most dangerous foes. As he walked triumphantly away with the matchlock, I could plainly see that he was no longer dangerous, and that we might count him among our best friends.

Then came the proa race, for which we took our place in a line. Moussoul started us with a matchlock, and Tamula got ahead at once, followed by the

other proas. We were last, singing our 'Hilo boys, hil-lo!' keeping about a hundred feet in rear of old Tamula, and going so beautifully that Abou was in raptures, and whispered to me that we could win. We, however, agreed that it was not prudent, and that we should make enemies by winning; though for my part I own that I had not bargained on Fatima's presence, and I hated the idea of being beaten before her.

Three proas soon fell off, but two others kept abreast with Tamula by considerable exertions, and we remained a hundred feet in rear. One mile, two miles, three passed by in this situation. There was one more mile to the stake-boat where we had to turn, and still there was no sign of fatigue in our fellows, who chanted cheerfully, but were evidently getting excited. Half a mile more, and one of the proas fell back level with us, and tried for a moment to get in front of us; but we put on a little extra pull, and passed her so quick that they stared and shouted. This brought us up nearer to the leading proas. There was a considerable space between them, as Tamula had chosen the right of the line, which would bring him nearest to the turning-point. Gradually we got nearer and nearer Nizam's proa, and could see the ladies under an awning. They were closely veiled, but for all that they waved handkerchiefs. My pride was touched: considerations of prudence forsook me. 'Abou, I can't stand being beaten,' I cried. 'Walk away, boys.'

Our Papuans at once took up the chorus, and that was the last of the race. The pirogue was as light as a cork and beautifully cut. There were ten sweeps with four men at each, pulling in the most perfect unison. When they started that chorus, they increased their pace, and began to shout it like incarnate fiends, pulling like Samsons. We shot between the leading proas like a ghostly vessel, and then past the stake-boat with a tremendous cheer; then we rounded her, Abou steering like a born yachtsman, and came on the homeward track, yelling our gibberish and our 'Walk away' at the very top of our lungs. The proas, as we passed, being quite out of the race, halted and shouted; but we never ceased until we had put a clear mile between us and old Tamula, who was second, leading the third by about two hundred yards. Then we relaxed a trifle, and came in winners to 'Hilo boys, hil-lo!' the darkies being very little distressed. Abdallah, when we returned, hardly knew whether to be vexed or pleased; but one thing was very certain—the pirogue was a great success. In about ten minutes' time Tamula made his appearance, the darkies blowing like porpoises. He took his beating admirably, which I was very well pleased to see, and received the gold bangles with a very good grace, only stipulating that I should build him a white man's proa. This, with a mental reservation, I agreed to do, to his great satisfaction. The shawl was adjudged to Abou who gave it to me, for which I thanked him heartily, being convinced that I should find in it some token from my darling.

The last race was the sampan race, in which Bikur, although a Sedi, had obtained permission to enter. I told him that he ought to be ashamed of mingling with the Papuans, as he was a Moham-medan negro; but as he pleaded hard, I permitted it, having always in my head a design to ingratiate

myself with the Papuans, as I had resolved to get a crew for the pirogue out of them for my elopement. Abou ordered our men to row us up alongside Nizam's proa, which they did, whilst I took the opportunity of going below into the cabin and examining my shawl. Pinned up in a corner I found a double almond blossom, which Fatima had put there; and this I took as an omen that she would assuredly be my wife; and I returned to the deck in the brightest of humours. As we came alongside I managed to catch Fatima's eye, and could read in it how delighted she was at our success. Then there was a cry of 'Ho, ho, ho!' and at the last yell the sampans started; the contest—the last on the list—being decided in favour of a Papuan who belonged to Tamula's proa.

This ended the races, which we wound up by a tremendous feast, during which Tamula had a long conversation with me about the proa I was to make for him, and gave me, in token of his satisfaction, two armlets of pure gold.

CHAPTER IX.—NIZAM.

When I left the festivities among the Malay huts, I impatiently sped up the hill towards the castle, hoping that I should not be too late to see my *fiancee*. What was my astonishment as I glanced instinctively to seaward and observed the topmasts of a square-rigged vessel emerging from the channel into the open harbour. The next moment I recollected that it was Nizam returning, and hoping, in all probability, to catch us napping, which he would certainly have done had it not been for my stolen interviews with Fatima. There was barely time for me to rush to the fountain, clasp my charmer to my arms, receive her congratulations, and warn her that her father was in the harbour. Then with a hasty adieu, I tore myself away with a heavy heart, and returned to arouse all the Arabs, and get them together quietly and without giving any information to the Malays, who I resolved should have a good startling, just to give them a wholesome fear of Nizam present or absent. Striding away silently, we armed and equipped ourselves, and manning the pirogue, loosened the sails, and steered directly for the vessel. Running alongside, we hailed them in Arabic: 'What ship's that?'

'The Shark. What ship are yea?'

I replied, for the joke's sake: 'We have no name;' and then, after a pause: 'We're waiting for the Nizam to give us one.'

A voice cried: 'Is that my Feringhi?'

'Yes, Nizam.'

'Is Abou there?'

'I'm here, Al Reis.'

'And Abdallah?'

'Here too.'

'And Mous-soul?'

'All here, Nizam.'

'Come on board.'

We went on board, and were surprised at the transformation. The Shark now bore the appearance of a man-of-war rather than that of a merchantman, guns being arranged methodically on each side of her decks, while the forty-pounder had been transferred to the quarter-deck as a stern-chaser. Nizam was standing beside it, and welcomed us warmly, kissing me on the cheek;

which was an immense mark of regard. He questioned us as to the new craft and its capabilities; and heard Moussoul's account of the bad temper of the Malays and their plotting against him, with ill-concealed anger. He smiled at the account of the day's transactions, and said that hereafter such things would be unnecessary as stratagems, but would be serviceable as diversions. We were now come abreast of the jetty and about a hundred yards from it, and he gave the signal for anchoring. Yet not a head stirred among the Malay huts. Then Nizam whistled shrilly, and immediately the men came tumbling up from below. I should think there must have been on board nearly three hundred. They were all armed in Arab style with tulwar and pistols, and made a splendid appearance.

In a moment they manned the guns, and at Nizam's order fired a broadside, which made the hills echo for some minutes. It was like stirring an ant's nest with a stick. In a trice the Papuans and yellow-skinned Malays came hurrying out from their sleeping-places, stark naked, but with weapons in their hands. We in the pirogue shot ahead, the wind serving, and anchored close to the shore, shouting to the men not to be afraid, for it was Nizam's salute in honour of Tamula. Immediately twenty sampans dashed into the water, and the Malay chiefs and warriors soon scrambled up the lofty sides of *The Shark*, and found themselves on her deck in presence of Nizam and his crew. I think Tamula's heart must have failed him, for he knew what he had been devising, but he was perfectly unembarrassed, and welcomed Nizam back with the utmost cordiality. Then occurred an act which impressed me more forcibly than any other I had previously witnessed, with the terrible powers of our great chief. The Nizam looked grimly at him, and without further parley ordered his immediate execution! Then he called for his boat and was pulled calmly ashore, ordering myself and Abou to attend him closely, and leaving Abdallah in charge of *The Shark*.

My sensations going up the hill were not the most pleasant, and there was something sticking in my throat which almost prevented me from speaking when Nizam addressed me. He perceived my state of mind, and attributed it to the act of summary vengeance which I had witnessed. This made him treat me all the more kindly, and he chatted in the most friendly, even paternal way. When we arrived at the castle, all the spearmen were outside waiting for him, and they gave him a wild Arab cheer. He passed on in great good-humour to his room, dismissing us with the kindest words and promises of reward on the morrow.

Abou wanted to talk about what we should get, but perceiving my abstraction, seemed hurt at it, and said that a good friend of the Reis should be pleased at Tamula's death, and not shocked. I pleaded my early education, which was too strong for me at the moment, but promised in the morning I would think as he did. So we parted, and I retired to my tower full of forebodings. I could not help thinking that perhaps my clandestine meetings with Fatima might have been witnessed by some slave, or by Nizam's wives, who, for some reason known best to themselves, had allowed the thing to go on. The Arabs are so subtle, so reticent,

you can never tell what a man feels when he is looking at you. His face may wear the kindest, friendliest look, and he may be plotting your death. What would happen to Fatima, whom I adored? What vengeance would her father take? Would he kill her? Or would he be satisfied with my death? I tortured myself pondering these things, and revolving them over and over, lamenting my folly in not carrying off Fatima at the time the pirogue was completed. And in the midst of these reflections I fell asleep.

My dreams were horrid: I dreamed that Fatima was starving chained to the mainmast of the pirogue. I was striving to convey food to her, and Nizam was aiming at me with the great stern-chaser. Again Fatima and I were wandering over a pathless desert dying of thirst. We saw a well, stooping beside which was an old dervish. He presented a goblet of crystal water to Fatima, and as she grasped it, the dervish changed to Nizam, and stabbed her to the heart. I awoke trembling, and found my forehead bedewed with great drops of perspiration. It was still dark, but there was a sighing sound going over the mountains and the sea which told of the coming dawn. I hastily descended to the courtyard, where the sentinels, knowing me well, saluted and allowed me to pass without comment. In the harbour beneath me the forms of the proas along the strand were all dark and jumbled together; but the pirogue and *The Shark* being by themselves, stood clear out against the starlit sky. There was just such a breeze as suited the pirogue. With Fatima on board I could defy the world in arms. But now it was too late. Nor do I hesitate to avow that I was unmanly enough to shed bitter tears at the thought that perhaps I might never see her again.

My head fell upon my breast, and I remained for some moments a prey to despondency. I arose with a start, for I could hear a humming noise like bees swarming in the Malay huts, and could faintly discern movements of small black objects. The Malays were preparing for a night attack to revenge their chief and to pillage the castle. The snake was scotched, not killed. I called a sentry, softly bidding him speak under his breath, and told him to listen. He put his ear to the ground and nodded comprehension. I told him at once to alarm silently all the men in the courtyard, and I would go and alarm Nizam.

The man faltered: 'Sakib, Nizam has retired.'

'I know it; but he must be roused. Obey, and question nothing.'

With this I flew up the stairs, and passed through the little room into the large chamber where we had feasted. I penetrated through another smaller room, and found myself at the curtains of the zenana. To pass here was death. I called loudly 'Nizam!' I repeated the cry several times, and at last Al Reis appeared sword in hand. He looked at me steadily, and heard me without a word. 'Wait,' said he, when I had completed my story. In a few minutes he returned dressed and armed, and descended with me to the courtyard.

The men were bustling about, though with caution. Abou was outside watching.

Nizam listened intently, and heard the murmur of the enemy. He studied for a moment, then led me aside.

'Feringhi, I know all. I know that you love my daughter, and have seen her. Were you an Arab, I would slay you as you stand; but you have other laws, and your ideas of women are different from ours. Now listen. There are, as you see, but few men, and we cannot defend this place against a night attack, because they know its weak points, and their force will be everywhere, and will distract the attention of so few defenders. Swim to *The Shark* at once—at once; if you take a sampan they will hear it. Swim under water; come up to breathe only; and direct them to aim at the Malay town and fire repeated broadsides. At the same time, let a hundred men, well armed, come off in boats and take their position at the bottom of the hill near the jetty. Do this, and we will talk about Fatima afterwards. I do not say that she may not be yours.'

I listened with varying emotions to this speech; at the end I kissed his hand with a devotion that words cannot express, and glided downwards in the darkness to the jetty, dropping into the water as silently as I could. Then I commenced my swim of a hundred yards under water, which, adroit as I had become in pearl-diving, was a comparatively easy task; nor did my head emerge many times before I found myself alongside *The Shark*. I signalled beneath my breath for some time without response, and it was only when I imitated the noise of a fish leaping that the look-out condescended to see me. Mistaking my head at first for a strange fish, he was going to spear me; but when I explained who I was, he threw me a rope.

As soon as I was on board, I hastened to Abdallah, who quickly had the men in the boats and ready to lower away. Then by a little careful manœuvring, *The Shark* was veered round, and presented her broadside to the town. I was in a boat, and fast as we rowed, could see that the Malays would get between us and the castle, though we had such a short distance to row. This would give them the advantage of the hill, but we had that of discipline. They had heard the noise of the boats, and doubtless suspected something, for as it grew momentarily lighter, I could discern that there was a large party just emerging from the town.

We disembarked quickly, hoping to attack our enemies on the hill, before the others could be near enough to render them assistance. But Moussoul would not let his men run, keeping them well in hand, much to my chagrin. My anxiety and impatience kept me at least ten yards ahead, and before I had the least intimation of it, a spear grazed my left arm and an arrow from a sampan whizzed by my cheek. At this I rushed on the foe with my tulwar, old Moussoul giving a fearful yell, and coming on like a trump to the support at a quick run.

In a minute we were at it in the fiercest style, and I lost my common-sense utterly, fighting in the most absurd way, cutting, hacking, thrusting with my tulwar, without using my brains for a moment. Soon in the midst of the mêlée we heard the roar of *The Shark's* guns just at daybreak, as if in compliment to the sun, and the broadside was succeeded by a continuous roar.

There must have been five hundred Malays and niggers engaged against us, and the sheer force of

numbers was gradually thrusting us down the hill, when Nizam himself arrived from the castle, and made an attack on the enemy's rear with such ferocity that he split their force into two portions, one on the side of the hill facing the sea, the other on the side facing the town and the river. We met in the centre, Nizam and I, and joining forces, made a tremendous charge on the enemy, driving them down the hill in confusion. Old Moussoul in the meantime maintained his ground against the others; and on our return we charged them again, and the day was ours. The rout was complete.

By this time it was broad daylight, and we could discern the enemy fleeing into the interior. The huts were all levelled, and there were numerous bodies around them, but the pious and my pirogue were quite safe, the enemy having been driven from them by the firing. Greatly to my surprise, Nizam despatched messengers to the town to hoist the white flag. *The Shark* had ceased firing, and a boat was leaving her steering for the jetty. We went down towards the town, and in fifteen minutes a Papuan came to know the meaning of the white flag. He had been sent by the brother of Tanula, and when brought before Nizam, trembled like a leaf.

Nizam looked at him contemptuously for a moment. Then he said: 'Dog, are your masters satisfied with their war against me?'

The sable envoy's teeth chattered, and he bowed his head in anguish to the ground.

'You are a *Kaba sur* [black hog]; but I blame you not, who obeyed the treacherous Malays, sons of Sheitan, whom I will wipe out. Remain here until evening, and then go back to your friends, and tell the Papuans that Nizam will give ten pounds of rice and ten pounds of the unclean meat for each Malay's head. Abdallah, see that he does not escape.'

The white flag still floated, but no more ambassadors arrived, and indeed both parties knew perfectly well that there could be no forgiveness, and that the war would last to the death. We returned in triumph to the castle, Nizam leaning on my shoulder.

Though Al Reis was a relentless foe, his generosity to friends was a marked peculiarity of his character, notwithstanding the episode I am about to relate.

At the courtyard he ordered his carpet to be spread, and he sat there surrounded by his officers. He ordered Moussoul to bring him all the Arabs one by one, and to each one he gave ten dollars in hard silver; to the petty officers he gave thirty-five; and to each principal officer he gave a handsome doubled of gold coins. To Abdallah, who joined us in a few minutes, he gave a string of pearls from his own neck; to Moussoul a thousand ashras of gold; to Abou the same and the pirogue. To me he gave nothing. I was cut on the forehead with a Malay crease, the blood was flowing from spear-wounds in my arms and legs; my hand was black with the blood that had trickled from my tulwar, and I bore abundant proofs of not having shirked the fighting.

Abou whispered to him: 'And the Feringhi, Al Reis?'

'For the Feringhi,' said Nizam, taking off his slipper with a scowl, and hitting me a violent blow on the cheek, 'there is this!'

A murmur of astonishment went through the people, and I was so beside myself with anger and weak from loss of blood, that I fell swooning at his feet.

LOBSTERS AND CRABS.

PERSONS who are not specially versed in the economy of our fisheries do not realise the possibility of exhausted supplies. They cannot, or will not, think it possible to exterminate any given fish or animal by capturing and killing it indiscriminately, till it falls below the power of reproduction, and ultimately becomes extinct. 'Our inshore lobsters are annually becoming smaller, whilst men have to proceed to greater distances to capture them.' This was written in *Chambers's Journal* for August 2, 1873; and these crustacean delicacies of the table having further diminished in size, it has been thought necessary to hold an official inquiry into the cause, so that a remedy for the scarcity may be devised. Once upon a time, and at no very indefinite period, lobsters, as a rule, were much larger than those now sent to market; they were also cheap compared with present prices. How comes it, then, will be asked, that lobsters are so much dearer and smaller than they were a quarter of a century ago? Knowing what we know now, through the inquiry lately prosecuted, and from other sources of information as well, the question is not difficult to answer. The most obvious fact of the situation is, that we are, in a sense, eating more lobsters than we breed! This may appear rather a startling way of putting the case, but it is undoubtedly the true way. Knowing the lobster, like other crustaceans, to be enormously prolific, it never seems to occur to the public that it is possible to affect the supplies, no matter how vast the consumption may be; and now, when the stern facts of failure in number and decrease of size have become patent, wonder is expressed at the facts, and doubts entertained of the cause.

It is much to be regretted that no official statistics of the number of lobsters which are annually brought to market are taken, and the same expression of regret may be applied to the want of a record of our supplies of all kinds of sea-produce. Those who are interested in the prosperity of our fisheries—and who is not interested!—can only guess at the quantities which are annually consumed. Fortunately, as regards the lobster we have a foundation on which to form an estimate of the total number eaten in Great Britain and Ireland, and the yield of this portion of the harvest of the sea is really remarkable. The rocky islands and coasts both of our own and other waters far and near, are laid under contribution to provide the British public with its lobster supply. From Norway and from Sweden, from Helioland, from America, from the coasts of France and Ireland, from Cornwall and the Channel Islands, from the Orkneys and the Hebrides, are brought most of the lobsters which grace our banquets. It became known, from the fact of the trade in lobsters being mostly in the hands of one firm, that, twenty-five years ago, as many as from fifteen to twenty-five thousand lobsters would be signalled to London in one day. Observe, these lobsters were not at once forwarded, otherwise the market would have become so glutted that a serious fall in the price

would inevitably have resulted; hence, intimation only of their capture was forwarded, and the stock kept ready for use as it might be required; in the same way as the living cod-fish caught in the North Sea are now stored in the harbour of Great Grimsby, in perforated boxes, to await the orders of London and provincial salesmen.

The calculation of the number of lobsters annually used in London, as a basis for an estimate of the total number consumed, was some years ago ventured upon, and the result arrived at was, that one million two hundred thousand of these toothsome dainties were used in the Great Metropolis. There is no reason to assume that the estimate formed was exaggerated; and as the population of London may be now set down as being one million more than it was when that census of lobster consumption was taken, an addition to the supply—notwithstanding the growing scarcity—of three hundred thousand may be safely made to bring it up to date; making the lobster consumption for the cities of London and Westminster and their suburbs at the present time a million and a half! It may be accepted as a fact, that the quantity of salmon eaten in Scotland is equal to the quantity consumed in London; but the same calculation will not hold good in the case of the lobster, because English people have a greater partiality for 'shell-fish' of all kinds than the Scotch. It would, however, be a very moderate estimate to allow for the use of Scotland and Ireland a million of lobsters per annum; nor would it be in the least an exaggeration to say that provincial England, in other words Liverpool, Manchester, Birmingham, Bradford, and many more populous places, eat as many lobsters as Scotland and Ireland; say, then, another million—making in all an annual consumption for the United Kingdom of three and a half millions! These estimates are supported by the knowledge that we derive from Norwegian and other foreign fisheries a third at least of our supply. In addition to consuming all the lobsters which can be obtained, London and other large towns of England delight in eating crabs, shrimps, and other crustacea. It may be mentioned that at least one million crabs are eaten every year in the modern Babylon; and as for the shrimps, whelks, and periwinkles annually consumed, it is scarcely possible to estimate the quantities. These figures seem enormous, but a little inquiry will demonstrate that they are within rather than beyond the mark.

As we have indicated, the crab, which may be called the poor man's lobster, has also been having a bad time of it. Its excellence as bait, now that mussels have become so scarce, is very likely to lead to its extermination, unless a gauge of size be speedily adopted. The demand for this crustacean has always been, and still continues to be, enormous; any number of crabs could be used in London and the other populous cities and towns of England; indeed, if it were possible to double the present supply, large as it is, eager customers would be found for all. There are many large stretches of crab-ground in the Scottish seas, and from all these localities the same tale is told of decreasing supplies. The crabs sent from Dunbar to London are so small that they are known among the dealers as 'Dunbar bugs,' and the price obtained for them is very trifling. As a further index to the crab supply of the Great Metropolis, it may be stated that one dealer is

in the habit of receiving daily twenty barrels of small crabs, each barrel containing two hundred. After all expenses are deducted 'on the transaction, the fishermen only receive the miserable return of four pounds sterling for the four thousand crabs contained in the twenty barrels. Many of the Scottish fishermen think that the capture of crabs might cease with advantage for six months in the year, and that none should be brought ashore which do not measure four inches across the back. In the course of the recent inquiry into the state of the crab and lobster fisheries, much interesting information was obtained regarding the natural history of these animals, to which we shall not further allude at present than to state as regards the lobster, that it may be found in prime condition at one place or another from John o' Groat's to Land's End every day of the year!

Hitherto it has been thought impossible to exhaust, by any amount of industry or ingenuity, the living things which inhabit the sea. 'Look at the enormous fecundity of all our fishes,' say those who think exhaustion impossible: 'the cod-fish yields its eggs in millions, while all other fishes are equally prolific; it is therefore impossible to over-fish.' These persons forget that the enormous power of reproduction with which fish are endowed is subject to constant casualties, that millions of ova are lost in the ravaging waters, and that what are left resolve at last into a very small percentage of mature fish. In the case of the salmon, which is, comparatively, a well-watched animal, it has been estimated that only one in a thousand becomes a full-grown reproductive fish; while as regards the herring, it is known that, in addition to the millions which are annually withdrawn from the shoals for the use of man, vast numbers are eaten by cod and other fish, as well as by various sea-birds which have their habitat on our rock-bound coasts and islands. It is doubtless to withstand the enormous demands which are made on its powers of reproduction, that each female herring has been endowed with the faculty of annually depositing twenty or thirty thousand eggs, because no lesser number could keep up the supply. The oyster, too, is vastly prolific, but it is an undoubted fact that oysters have become scarce, and are now very dear in price, which has doubtless arisen from the circumstance of the natural scalps being so overredged as to render many of them unproductive.

The fecundity of the lobster is well known. A fair specimen, say of three-and-a-half pounds in weight, yields about six ounces of ova, each ounce containing from five to seven thousand eggs. Let us say, therefore, that a sizeable specimen will produce thirty thousand young ones, if all the eggs should come to life. At that rate of production it apparently only requires some two hundred and fifty parent lobsters to yield the ova necessary for the lobster supply of Great Britain and Ireland. There are, however, other enemies than man which prey upon the lobster. The 'berry' or spawn forms a palatable meal to countless numbers of sea-animals constantly on the watch to feast upon it, and knowing with keen instinctiveness the time at which a supply can be obtained. The denizens of the sea know no better than to prey upon each other; the great ones eat the small ones without any compunction, and the ova of all are devoured

indiscriminately by all. Better behaviour might, however, be expected from the most intelligent enemy of the fish; but, on the contrary, man throws the whole weight of his superior cunning and ingenuity into the scale, and captures fish and crustacea at the most inopportune seasons. It is, for instance, when the herring is full of spawn that the greatest number of that fish are captured; and just as, long ago, men dining on salmon used to insist upon having a supply of the 'pen,' as the roe was sometimes called, so the cooks of to-day insist upon being supplied by the fishmonger with 'hen' lobsters, having a plentiful show of the 'berry,' which they use to colour their sauces. One dealer in shell-fish is known to have collected and disposed of as much as ten pounds-weight of this spawn in a season, which quantity would represent the destruction of eight hundred thousand embryo lobsters; and if throughout the kingdom there are two or three hundred salesmen, each furnishing a similar supply, they will help to play havoc with this fine crustacean. It may reasonably be estimated, from what is known of the salmon, that not five of the eggs deposited by the lobster ever reach the market as full-grown individuals. The three millions and a half of lobsters consumed in the United Kingdom represent a vast bulk of food; and when we take into account that France, Holland, Belgium, and Germany draw their lobsters from the same sources that supply Great Britain, it will be at once apparent that the productive force of the animal great as it undoubtedly is—is being overtaxed, that, in short, our crustaceans—we include crabs as well as lobsters—are being so over-fished as to bode ultimate extermination.

On this point, convincing evidence has been obtained; the combined testimony of the witnesses examined tends to prove that the lobsters now brought to market are only about half the size of those obtained about twenty years ago, and that the greatest industry is required to capture as many of the small specimens as it was then possible to obtain of the large ones. One witness, and he may be quoted as a type of those examined, told the Commissioners, in the course of his examination, that whereas he used to capture, thirty years ago, from a thousand to eighteen hundred of these animals every year, he cannot now obtain above four hundred. 'I attribute the falling-off in the take,' says another witness, 'to fishing all the year round for great and small.' It was also given in evidence that the smacks which came from London thirty years since to collect the lobsters fished on the north-east coast of Shetland, used to return home with from twenty to thirty thousand lobsters! The price then paid was sixpence, sevenpence, and eightpence; more than double these prices have to be paid now, and for smaller lobsters. The supply of this member of the crustacean family obtained annually from the Orkney Islands does not now exceed sixty thousand, whilst formerly more than double that number was collected. One man who gave evidence on the subject said that he had sold upon one occasion as many as a thousand small lobsters at half-a-crown each; the price usually paid to the fishermen is now one shilling and sixpence, and those under four-and-a-half inches in the barrel are taken at the rate of two for one.

It is proposed, as a remedy for the falling-off in

the supply, to establish a close-time; but as to how such close-time should be arranged, there is considerable diversity of opinion. The proper time to abstain from taking fish of any description is when they are engaged in reproducing their kind. During that period of their life salmon are watched with jealous care, and heavy fines are very properly inflicted on poachers and others, who capture these fish when they are in their gravid condition; moreover, at that period of their life fish are least fit to be eaten, because all the elements which conduce to the growth of their flesh are diverted to the formation of their eggs. In so far as many people prefer the herring, cod, &c. when full of roe, so it was stated by various witnesses who gave evidence as to the falling-off in the supply of our crustaceans, that when it is in 'berry' the lobster is in its best condition for food, and that, whatever the close-time, it should not be such as to prevent the capture of 'berried hens.' Under these circumstances, it will be somewhat difficult to solve the problem of a remedy for the decrease in size and the falling-off in the supplies, and perhaps the best mode of settling the question would be to institute a law making size the index of capture. If no lobster were to be legally saleable till it had attained a given size, say of seven and a half inches in length, a better state of matters would very speedily be inaugurated, and lobsters become as numerous and as large as ever they were. There could be nothing to prevent the observance of such a law, seeing that lobsters are taken alive, and that they could be easily restored to the water when found to measure less than the legal standard. The sale of spawn ought likewise to be prohibited, till such time at least as the average size of all lobsters attain the statutory dimensions which have been indicated. It will be a thousand pities if the lobster has to be added to the catalogue of our extinct animals; and such a contingency may not be so remote as some imagine, for if in the course of a quarter of a century the average of size has fallen from eight to four and a half inches in the barrel, another twenty-five years of wasteful fishing may so reduce it in size and numbers as to render it unproductive. In any case, what we have stated goes far to prove that the lobster and the crab are in danger.

WEDDINGS AND WAKES.

ANY ONE who has lived amongst the Irish people will know that, with them, love is by no means an overmastering passion. The instances of crime committed with love as an incentive, are rare; you seldom hear of Pat stabbing his sweetheart in a fit of jealousy, or pommelling his more fortunate rival to death, as is the case elsewhere. In general, and particularly in the north of Ireland, marriages are arranged in a cool, mercenary spirit, which does not leave much room for romance. They are generally conducted by the fathers and mothers of the contracting parties, in the presence of either the landlord or agent, and the scenes—as we attempted to shew in a recent number of this *Journal*—are sometimes in the highest degree comic. The parents haggle over the terms of the agreement, without the slightest regard for the feelings of the young people, who are looked upon as so much live lumber. A pig, a cow, or a sheep, has often been

the cause of breaking off a match nearly concluded; even a goose has been known to turn the scale. Very lately, in a certain province in Ulster, a well-to-do farmer had for some time been dividing his attentions pretty equally between two fair ones—one a widow; the other, the only daughter of a rich pig-jobber. The cause of the gentleman's vacillation was, that each of the candidates had the identical qualification—a cow and two pigs. The matter was at last decided by the girl's father throwing in a *bween* (young pig), which at once decided the matter, and the widow was non-suited.

A friend told me an amusing anecdote of two of his tenants who were arranging a marriage between their respective children. Both were wealthy cattle-drivers, and the matter in dispute was not beasts, but hundreds. After much haggling over the terms, the matter ended by the father of the young man saying: 'Give another hundred, and faix be my soul, you may dirty the boy.' I add, for the information of those who do not know the custom of an Irish fair, that when an animal is finally sold, the buyer always rubs a piece of mud on its quarters; this is called 'dirtying the baste'; hence the apropos expression of the drover.

The ladies are not exempt from a strong desire to make a good bargain, and can look after their own interests with great zeal; an instance of this happened in the writer's own family. A female servant who had been a fixture for many years suddenly announced her approaching marriage. She was elderly and very plain, but was known to have laid by a good bit of money; consequently it was supposed that her money, not herself, had attracted the suitor; but she was strenuous in declaring that his means were to the full as good as her own. The wedding was given at her master's house; and on the day appointed, the bridegroom and his friends arrived. Every one was ready to start for church, when suddenly a hitch occurred—the bride laid down her marriage portion on the kitchen-table, and called on her future husband to produce his. It was not forthcoming; and on this, Biddy stoutly refused to fulfil her engagement. No entreaties would induce her to move one step, till she saw the money down: promises wouldn't do; ocular demonstration she *should have*. The mortification of the farmer was so great, that every one joined in trying to mollify the indignant *fiancée*. But no other answer could be got from her but: 'Ah, good sir, shure, he hasn't the property.' It was all in vain. The discomfited swain had to return unmated; and the obdurate Biddy died in single-blessedness. It would be a mistake, however, to suppose that these marriages, which ape closely the *mariage de convenance* of our French neighbours, are unhappy unions; far from it. Although Pat is not particular in the matter of looks or age, and will pass over a pretty girl in the heyday of her good looks, to take 'an old piece,' as they phrase it, with a comfortable acre of land for the potatoes; still, once he is tied up to the matrimonial rack, he makes the best of husbands; no wandering from his allegiance. As a general rule, the wife reigns supreme in an Irish cabin. Even when the 'dhrap' is in, he seldom if ever beats her, and cheerfully surrenders into her keeping nearly every farthing of his earnings.

In a rather retired part of the south of Ireland, near to the once famous Skibbereen, a curious and not uninteresting custom prevails, called

'Shraffing.' It takes its name from Shrove (otherwise Shrafft) Tuesday, on which day a regular matrimonial 'Tattersall' is held, where all the 'likely boys' and 'girls' in the parish are on view, and all the 'matches' in the year are made. For days before, there is quite a stir in the neighbourhood; and a twitter runs through the entire female population. There is a universal stitching and buying of ribbons; every girl you meet on the road holds out her hand for a 'sixpence;' and you can't speak to a domestic servant without her hanging out signals of distress. Indeed, there is this objectionable side to the proceeding, that it disorganises one's establishment; for just as you have caught and trained a neat-handed Phyllis for yourself, she is sure to be pounced on and carried off by some of the coast-guards, who always attend the shraffing from the fishing-village near at hand. The shraffing is in itself a pretty sight, and would furnish a subject for the pencil of any wandering artist, if such came that way. The girls stand in a row on the village green, under the spreading branches of a fine old copper beech-tree. There is every expression on their faces—anxiety, curiosity, timidity, dull stupidity, sharp shrewish interest; and here and there you come on such a pretty country beauty, with that indescribable half-arch, half-shy look in the eyes which MacIse has caught in perfection. At a little distance are clustered a lot of shame-faced-looking men—the boys, as they are called—all in their Sunday suits, and evidently ill at ease, eyeing with some distrust the superior attractions of the coast-guards, who are like the red-coats, favourites amongst the ladies. But that in reality matters little, as the real conduct of the affair is in the hands of 'the powers that be,' the fathers and mothers, who haggle and quarrel over their respective children, sometimes breaking up the negotiation abruptly, and carrying off either son or daughter, as the case may be, as they would an unsaleable beast from a fair. Of course, little bits of romance crop up here, as elsewhere; cases of Money versus Love, and young hearts sold to the highest bidder, just as they are in a Belgravian drawing-room. By-the-bye, what wouldn't our fashionable mothers and worn-out chaperones give for a shraffing to be held once a year in Hyde Park; how much trouble and expense it would save; and what glorious fun it would be to see the Countess of D. — and old Lady Mantower having a hand-to-hand fight over the persons of Lord Fitznoodle and the Honourable Emilia!

Another advantage in this mode of arranging marriages, and which, doubtless, would find much favour with ladies of the Mantower class, is, that no time is allowed to timorous lovers for repenting of their rashness. Execution follows promptly upon sentence, otherwise agreement between the parties; and delays are considered dangerous, as the six weeks of Lent are at hand, during which a fast is imposed upon matrimony, as upon other good things. I remember, on one occasion, after a shraffing, meeting a disconsolate fair one on the road sobbing as if her heart would break. She happened to be on ordinary occasions a particularly bright-eyed specimen of Irish beauty, so the change was the more remarkable. I couldn't pass her by in her sorrow, and accordingly accosted her with: 'Why, Peggy, what's the matter? Is it possible that the boys have passed you over? Never mind; better luck next time.'

'Och, shure, thin, your honour, it's not that at all. Shure, I have me boy all settled; it's Micky Byrne, your honour, as likely a boy as ye iver set eyes on. Och, oh, oh, oh!' And the sobs burst out with renewed vigour.

'Then what's wrong, Peggy?' I asked sympathisingly.

'Ah, thin, shure, neither of us have the half-crown to give his rivrence, and we can't be married till after the harvest; and och, what shall I do, what shall I do?'

Here was a case for real charity; I could not keep my fingers from my pocket; and Peggy went away happy. Mr and Mrs Mick Byrne are now a thriving couple, and Mrs Byrne never omits her annual offering to the state.

In many parts of Ireland, most of the matches were made (and still are) at wakes. This unnatural mixing of the living and dead is to us very revolting; but a writer in a contemporary magazine has made a great effort to defend the practice. He says it is a common plan to 'vary the periodical wail by a little mirth, jollity, and courting,' and that nothing *can* be more unjust than to brand the Irish nation with want of feeling for doing what is only in accordance with the natural law of human nature, which rejects a continuance of sorrow. In a state of greater simplicity and absence of conventional usage, the writer contends we would all act alike; and in proof of this, he draws an analogy between the lower order of ancient Greeks, who had much the same customs in regard to their dead as the Irish. He acknowledges, however, that he cannot excuse 'the extreme case of a man (whom he knows personally) who proposed for his second wife *at the wake of his first*.' There are other things besides this extreme case which grow out of the custom—that is, the excess of drink and the amount of superstition, which in some parts are equal to pagan rites—such as putting money into the hand of the corpse, and a lighted pipe in the mouth, making it walk about, &c. The application of the dead man's hand to a sore or wound is considered efficacious; nor are there wanting instances of cures said to have been effected in this manner.

There is no doubt that the custom of waking or watching originated with the Irish in an affectionate feeling towards their dead relatives, whom their natural kindness prompted them not to desert, as it were, nor to leave to the attacks of evil spirits, who hover, in their fancy, round the body to do it an injury; hence the lights and holy-water. This same idea, in almost an identical form, prevailed in Cleveland in Yorkshire, where, indeed, it is only just extinct. The 'lyke-wake,' or 'late-wake,' was here maintained sometimes for a few days after the body was laid in the grave, and there were more superstitious practices than even in Ireland.

In addition, says another writer, to the lights and the holy-water, a plate of salt was put on the breast: these were held to be efficacious for the watcher as well as the dead; above all, the door was always either wide open, or carefully closed, lest some fearful apparition should enter. The reader of *Guy Mannering* will remember Meg Merrilies opening the door *wide* when she was busy in her ghastly ministrations about Dirk Hatteraick's corpse. She also chanted some diabolical verse, something similar to the lyke-wake

dirge which is sung in Yorkshire, but which properly belongs to Cleveland :

This ae night, this ae night,
Every night and alle,
Fire and fleet and candle-light,
And Christe receive thy saule.

In parts of the north of Ireland there was at one time, some forty or fifty years ago, a rather romantic custom, that when a very young unmarried woman died, her coffin should be carried by young girls only, to the graveyard. As this was situated perhaps fifteen miles from where she had lived, it was arranged that the bearers should be changed every second mile; and on these occasions there was generally an escort of running volunteers, who in this way often did their thirty miles in the day. This custom was called 'shifting the coffin;' and a good many marriages were the result of these excursions. The lower order of Irish have an inborn taste for funerals; and in the amount of honour done to the departed, they lose sight of the actual loss they have suffered.

'Och, shure, thin, it was a fine berryin; there was a sight of people and a power of cars,' is as great a eulogium as can be accorded to any man, and will quite console the survivors; and the reverse: 'Och, thin, he didn't lave enough as would berry him decent.' In fact, they think far more of how they are to be buried than of keeping life itself. The poorest and the most improvident lays by something for his or her own wake; and I have myself known cases of paupers in the hospital wards who were accumulating under their pillows a little store, to save the disgrace of a parish coffin; that being the greatest and last misfortune that could befall them. Douglas Jerrold was much struck by this phase of the Irish character; and it is he, I think, who tells an affecting story of a young girl whom he found in a cabin busy at her needle. 'I see you take in plain-sewing: this is some bridal grandeur,' he said, taking up what looked an elaborate night-dress.

'Tis no wedding grandeur,' replied the girl proudly; 'shure, 'tis my own shroud. Let life bring what it may, plaze God, I'll have a decent wake.'

Mr Disraeli said once, that the vast ocean which surrounds Ireland makes the Irish 'a melancholy people.' Perhaps it may in some measure account for this morbid tendency, which is a national characteristic; but I would rather think that with them, as in all artistic natures, tragedy and comedy touch very closely, and that quick sympathy in either joy or sorrow comes readily to them.

THE SLAVE AND THE COOLIE.

THE difference between the slave and the coolie is given by Mr Cooper in his book entitled *A Lost Continent*. It is a distinction, but with scarcely any difference, as the hardships of either class are distressing to contemplate. When Mr Cooper writes of *A Lost Continent* he alludes to Africa, which is nothing less than a slave-mine, from whence human beings are drawn to enrich unscrupulous traders and supply eastern civilisation with its chief luxury. Herein lies the secret of the mischief and difficulty of the problem attending slavery and its suppression. So long as the

demand exists, the supply will continue. It is almost hopeless to expect that the African will be permitted to remain in his own land so long as Mohammedan nations regard labour as degrading, fit only for slaves. With this strong prejudice against work, it is not surprising to find that they are only too glad to purchase their fellow-creatures as substitutes, while unscrupulous traders are never lacking where the reward promises to be handsome.

It is now three centuries since the African slave-mine was first sprung by Christian hands, since when more than fifty millions of slaves have been driven from it, out of which Dr Livingstone declares that not one in five, and in some instances not one in nine, could have reached his destination. The loss of life, therefore, can be computed at something enormous—sufficient to warrant Mr Cooper in naming the continent of Africa as *lost*—for of the survivors of these fifty millions it is known that rarely has there been a second generation among the slaves, and never a third. Sir Bartle Frere, who has taken such an active part in the suppression of the slave-trade on the east coast of Africa, suggests as a remedy, that Christian countries should signify to the slave-holding countries Turkey, Egypt, and others—that, until they relinquish slavery, they will not be admitted into the brotherhood of nations. The Khedive, it is believed, would gladly see slavery abolished in his dominions, but he is held in check by the fear of injuring the more opulent of the European mercantile and financial class in Egypt, who make enormous profits out of the present state of things.

The Portuguese on the east coast, who are supposed bound by their government to suppress the slave-trade, evade their responsibilities in the following cunning manner: They employ Arab dhows under an Arab flag; thus, if discovered, the Sultan gets the blame. When they send slaves by any of their own vessels, they resort to the device of shipping them as 'free negroes,' and furnish them with passports; thus evading detection. But the poor slaves themselves, when questioned, all tell the same tale—how they have been stolen, dragged from their homes and families, and sold and bought several times over. The price of a slave in Turkey is from thirty to fifty pounds.

Slavery as we know, is not alone confined to eastern nations. It is carried on to a large extent in Brazil and Cuba. We are given a peep at slavery as it exists in the latter place by an eye-witness, Captain Trench Townshend, who describes how he saw, when visiting a sugar-plantation, 'fifty or sixty negro children, from six to twelve years old, of both sexes, piling the canes on the elevator which conveyed them to the crushing-wheel. Toiling away for their very lives in the broiling sunshine, the poor little wretches kept a constant eye upon a formidable cow-hide whip, wielded by a negro, who stood ready to crack it across their backs if they were idle or ate the sugar-cane. When he left the children to visit the negro barrack, the narrator passed two ferocious Cuban blood-hounds, which are trained to run down and attack negroes only. The negroes' rooms he describes as filthy horrible dens, about fourteen feet

square, walls black with dirt, and no means of admitting daylight or air except by the door; a wooden table, bench, and bedstead, the sole furniture; the remnants of a filthy blanket on the bed, while the worst filth covered the floor; furniture and walls being alive with vermin. In each of these pestiferous dungeons lived a whole family in a condition more foul and degraded than any beasts of the field. The imported African seldom lives longer than five years. 'Eighteen hours a day for six days out of seven under a Cuban sun is horrible brutality, and soon wears out even the magnificently powerful frame of the African, whose strength is kept constantly exerted to its utmost efforts by the lash of the slave-driver.' 'What I saw of slavery on the Cuban plantations filled me with horror of the institution, and quite did away with my previous leaning towards it in the milder form,' says Captain Townshend.

Thus much for the poor African slave. Now let us glance at what Mr Cooper calls 'a new slave-trade, which has sprung up within the last forty years under the name of immigration.' In other words, the coolie. The immigrant is not actually sold at first, like the slave. He is made to sign a contract, whereby he becomes the property, *de facto*, of another; and as this other man's property, he can be sold by him as though he were a slave. In fact, 'What is the price of coolies to-day?' is as common a question among those who deal in them as the price of stocks would be on 'Change.' Captain Townshend, whom we have already quoted, says: 'Though the fate of the poor African slave in Cuba is horrible, that of the unfortunate Asiatic who is serving under contract struck me as even more pitiable. The wan face, feeble frame, and dejected looks of the wretched Chinamen were absolutely painful to see.' Having enjoyed the blessings of freedom in his own country, the poor Chinaman finds it is lost as soon as he has signed the contract and gone on board ship to a distant land. On reaching Cuba, he shares the fate of the negro slave, against which he rebels very often, and either runs away or engages in some trade in the large towns, or wanders at large forlorn and heart-broken. It is against the law to subject him to the lash or sell him, but the law is set aside in either case. The coolie signs a contract for seven years, at the end of which time the government lays hands on him, keeping him still a prisoner; 'so that not even after seven or more years of slavery does the unfortunate Chinaman regain his liberty.'

But if the coolies are hardly treated in the islands, they are inhumanly dealt with in Peru. In twenty years ninety thousand of them perished; and the death-rate on the passage from China to Peru in the immigrant ships has been twenty-five per cent. They are hired to labour in the guano-work, and are goaded to action under the lash. The negro overseers are armed with the lash of four plaits of cow-hide. The weapon is not put into requisition until towards the end of the day—about four o'clock—when the strength of the coolies begins to flag, and they shew signs of falling short of their allotted task, and the punishment then undergone is too harrowing for description. It is little short of murder.

The truth of treatment such as this existing in Peru has been fully borne out by men of note. Sir Charles Wingfield says: 'The fate of the imported coolie is abominable. . . . There is a

military force to guard them, and to crush any violence to which despair may drive the most timid of men. Hope of escape, save by death, there is none; hence suicide is a common practice regularly estimated in the probable cost of the labour supply.'

Mr Thomas, the American Minister at Lima, says: 'I am prepared to say that the treatment of these unfortunate Chinese, thus forced violently from their homes by the landholders of Peru, by whom crowds of them are employed, is more harsh than that to which the slaves in the United States were formerly subjected.'

In the list of property for sale, coolies rank among the pigs and horses and oxen.

And now a word as to the nature of these 'contracts,' which the victims so ignorantly sign. Bishop Patterson gave it as his opinion that it was not possible for any trader to make a *bona fide* contract with any of the natives (speaking of South Sea Islanders); contracts therefore are frauds. The government of the United States does not recognise them, and made it felony for American ships to carry coolies under labour-contracts in any part of the world. They are wholly unnecessary inducements, as the Chinamen, as we shewed in a former article in the *Journal*, are only too glad to better their fortunes, and make excellent immigrants. But they will not work as slaves, especially when they find that they have been deceived and have fallen into a pit for seven years, from which there is no delivery save by enduring a cruel bondage, rather than suffer which many prefer death.

The accounts from Peru, as late as a year ago, shew no diminution of their sufferings. In a letter which Mr Cooper gives in his Appendix, dated May 1875, it says: 'They are driven from their lairs before daybreak by a brutal black-fellow on horse-back, who follows them as the whipper-in does a pack of hounds. They start away without food, and about eleven or twelve in the day a cob of raw maize is given to each one; or, in some cases, nearly a pound of boiled rice. They are kept at work for the rest of the day, and after darkness has set in they are permitted to return to their lairs. Before being dismissed, however, they are given another cob of corn. With no other food they frequently get ill, when they are removed to the hospital—a bourne from which, according to subsequent description, no patient ever returns—to die. As soon as their first term of contract is over, they are re-entered upon the estate, and this is repeated over and over again to the same man, if he happens to live. The survivors, in fact, are given the names of those who die, and who, had they lived, would have had several years more to work before the expiration of their term. Thousands commit suicide on the various guano islands; as many as ten or a dozen in a morning find the opportunity of jumping from some high place into the sea.'

These are a few of the facts culled from Mr Cooper's book, which might be aptly termed a tale of horrors. We read of the slavery of the Israelites in Egypt, and many of us, at our ease, look upon that time as an historical epoch which could find no parallel in later times; but a glance at these recorded horrors, which rival any that have preceded them in the world's history, shews that our advancement has yet to progress to a higher

point, and that our civilisation cannot lay claim to perfection until we have risen as a nation and invited others to follow, in setting the oppressed ones free.

CATCHING TARTARS.

A RUSSIAN OFFICER'S STORY.

'You English talk about "catching a Tartar,"' says Lieutenant Dmitri Sobolyoff, as we sit at the open window of Anton's Hotel, in the main thoroughfare of Orenburg, watching the camels filing across the road to the great market-place, and the bullet-headed children, with the flat, fallow face and narrow eyes of the genuine Tartar breed, rolling in the dust of the street below. 'You English talk of "catching a Tartar," but with us in Russia it's just the other way—in all our stories it's the Tartar that gets caught himself. We haven't forgotten their conquest of us in the thirteenth century; and to this day, in Kazan and the other towns of the Volga, where there are many of them, you'll see fine fights every now and then between the Tartars and the Russian workmen. And as for stories—why, I wouldn't mind betting that, the first jest-book of ours that you open, you'll light upon half-a-dozen anecdotes of a Tartar being taken in by a Russian. Do you know the one about the two horses? Well, a Russian and a Tartar were crossing the steppe together, the Tartar mounted on a fine black horse, the Russian on an old broken-down white one. When night came, the Tartar proposed that they should watch turn about. "Not I!" says the Russian; my horse isn't worth stealing, and I don't care whether they steal yours or not!" and with that he lay down to sleep. Well, the Tartar, who was a lazy fellow, and didn't much enjoy the idea of watching all night by himself, proposed to exchange horses; which was done. Thereupon, to his great dismay, the Russian very coolly lay down to sleep again. "What now?" says the Tartar. "Why?" says the Russian, "what's the good of my keeping watch now? the robbers won't see my black horse in the dark; but they'll see your white one fast enough!"'

Encouraged by my approval of this time-honoured Russian joke—though I have heard it said that white objects, such as white-painted ships, are, in reality, *less** recognisable in the dark than black ones—the lieutenant calls for another glass of cognac, and sips it with true national gusto.

'We, however, use the term "catching a Tartar," in a metaphorical sense,' observe I.

'Ah! just so. Well, I've seen some pretty good cases of *that* too; and, curiously enough, the most perfect of all was an adventure that happened to myself, about two years ago. Would you like to hear it?—You're sure you won't have some cognac? Well, 'pon my word of honour, you're the first Englishman I ever met that wouldn't take liquor when it was offered him! You'll have a glass of tea though, at all events!—Waiter! a glass of tea for this gentleman.

'Well, I was in St Petersburg the winter before last, and a fine time I had of it there. *That's* the

place for a man to live, instead of a hole like this, where there's nothing to do but to drink cognac, and smoke *papirossi* (paper cigarettes), or sit on the boulevard and watch the Ural flowing past underneath! That winter, I do believe, I was out every night—balls, dinners, the opera, the French theatre, and what not; and as for cards—why, I lost a thousand roubles (L.150) in one week! Ah! those were the days if you like!

'Now, I ought to tell you if you weren't in St Petersburg that winter—that, just about that time, there was a great to-do about street-robberies. There are always plenty of them, every winter, for that matter; but at this particular time there seemed to be quite an epidemic of robbing. One fellow, in particular, seemed to have a regular system of his own; he used to take an *izvoshchik* (cabman), and make him drive slowly about the streets after dark, till somebody came in sight with a specially good fur cap on; and then, while the cabman put his horse to the gallop, the thief would lean forward, snatch off the man's cap as he passed, and be out of sight in a moment. However, he caught a Tartar at last; for a man who had heard of him, went out one night with a new fur cap tied on tightly; and when the thief clutched at it, he seized him by the wrist, whisked him out of the drosky on to the pavement, and gave him such a thrashing, that every limb of his body was as soft as *kasha* (buckwheat porridge).

'But this was not all. For now there began to get abroad strange tales of people who had gone out to evening-parties and never come home again of cabmen with rich furs and silks found in their possession, which they couldn't account for—of bodies discovered under the ice of the canals—and other tales of the kind; till at last there was a regular panic, and no lady would stir out alone after dark. As a matter of course, while all these pretty stories were going about, they revived, for the hundredth time, the old tale of a lady being put under the ice of the Moika Canal by a cabman, and her husband happening to recollect the number of the cab, and tracing the man out by it. I've heard the tale myself at least fifty times, and there's no more truth in it than in the *History of Bova Korobéitch* (a mythical Russian champion); but people will believe it, for all that.

'Well, as you may think, when these things became the stock subject of talk throughout the whole town, the fellows at our mess must have their say about them too; and, after a time, they became a regular subject of dispute with us after dinner. Most of the subalterns—and I myself among them, I must confess—pooh-poohed the whole thing, and said it was nothing more than a big hoax, got up to take in people who knew no better; but the older heads among us, who had seen such things before, thought otherwise. They allowed that there might be a good deal of exaggeration about some of the stories; but, nevertheless, they maintained that these rascalities were going on, and that it was no use saying they were not. At last, one night, when the argument had run pretty high, our senior major, a battered old fellow, who had been all through the Crimean War, said to me very quietly: "Well, you'll begin to believe in these things when you get a taste of them yourself." And so I did, too, as you shall hear.

* A knowledge of this fact has, we believe, been frequently taken advantage of by blockade-runners, who to lessen the risk of capture paint their ships white.—Ed.

'That was a great winter in St Petersburg for fancy-balls—things that I am very fond of, for you can get more sport out of them than anything else I know. Dozens of times, for a wager, I've gone to one in some queer disguise, and not one of my comrades, though they were all there, could find me out; and rare fun it used to be next day, when I repeated the things they had said in my hearing, and watched their faces of astonishment.

'Well, one night, just after the New Year, there was a grand fancy-ball at Princess P—'s, and some of our fellows were invited, I among the number. A famous evening we had of it; and it wasn't till two o'clock—the very dearest and loneliest time of the whole night in fact—that I started to go home.

'Now, I should tell you, that, as my luck would have it, I had just bought a new *shoob* (fur coat) the day before—a regular first-class Siberian, glossy as velvet, and covering me right down to the heels; so that, what with that, and what with my fur cap and collar, I was regularly rolled up like a parcel, and proof against any frost in Russia. But, unluckily, other people have eyes for good fur as well as one's self; and the moment my cabman got *his* upon this new *shoob* of mine—worth a hundred and fifty roubles, good, if it was worth a kopeck—I saw them glitter like fire. Just for one moment—I can't deny it—the old major's warning came back to me rather unpleasantly; but I laughed it off, scrambled into the sledge, and away we went.

'There were two ways to get to my quarters—one rather long, but passing through well-frequented streets; the other somewhat shorter, but going past one of the great burial-grounds, through the very loneliest part of the whole town. I took it for granted, of course, that he'd go by the frequented way; and, indeed, being rather tired with having been on my feet all night, I fell asleep before I could see whether he did or not.

'All at once I was awakened by the sledge stopping suddenly; and the first thing I saw when I looked out was the great black waste of the burial-ground right ahead, with the white graves glinting here and there in the moonlight. Not a living soul in sight, not a sound to be heard; everything was silent and lonely as if we had been in the middle of a desert. Then the fellow turns round to me, and says roughly: "Get out!"

"Whatever do you mean?" asked I, pretending to be very much frightened.

"Get out," says he, "this minute!" and he jumps off the box and catches hold of me.

'Now, before I go any farther, I must tell you that the character I had assumed that night was that of a *demon*—horns, tail, black face, fiery eyes, and all; and really I looked a very grisly object! I got the idea out of a book written by your Captain Marryat—I forget its name.

'*Midshipman Easy*, suggest I.

'Ah, that's it; *Midshipman Easy*. Well, when the fellow caught hold of me, I scrambled out of the sledge in a helpless kind of way, as if I were frightened out of my wits. He seized my coat by the collar, and threw it open, my cap falling off at the same time; and there I stood revealed in all my terrors, as grim a demon as ever breathed fire, with a face as black as ink, and eyes flaming like live coals!

'I've seen many men frightened in my time, but never anything like that fellow! For a moment he stood like a statue, with his eyes starting out of his head; and then he gave a yell that you might have heard a mile off, and fell flat on his face as if he were killed; and I sat down on the rim of the sledge, and laughed till every grave in the churchyard ha-ha'd in answer.

'However, I had something more to do than to sit there laughing; so, as soon as I got my breath again, I bundled the fellow neck and crop into the sledge, got on the box myself, and drove as hard as I could pelt to the nearest police-station. When I got there in my diabolical guise, I created almost as great a sensation as I had done with my friend the cabman; but the whole business was soon explained, and when they heard the story, there was such a laugh that it almost tore the roof off. The fellow who took down my evidence could hardly write for laughing; and when the poor cabman himself began to come to again, the first thing he saw was my horned head and fiery eyes hanging over him in a glare of firelight, and roars of infernal laughter making the air ring; whereupon he fainted again, worse than before.

'I didn't want to be hard upon the poor chap after the fright I'd given him; but the inspector said that now that the thing had got to such a height, an example *must* be made, and he would see that the fellow got his deserts; and so he did, too. But from that night forward, our officers never called me anything but "Izvoshchikoff Strakh" (the cabman's terror), and I haven't got rid of the name yet.'

THE TORTURE OF BEARING-REINS.

The severe bearing-rein as used by coachmen generally is nothing more nor less than horrible and needless torture to the poor suffering horse—torture while in harness, and the cause of internal maladies when he is put back into his stall for food and supposed rest. If there is one thing more opposed to natural health than another it is the increased production and then the waste of the saliva which is so necessary to the functions of the body. Who ever saw a horse in a field foaming at the mouth? Who ever saw a properly bitted hunter do so when ridden to hours in an easy bit and obedient to a light hand? I never saw it, nor do I think that any one else has seen it; therefore, to begin with, the position of the carriage-horse's head, gagged with a bearing-rein, cut of place, and that profusion of saliva ever falling from the mouth, must shew something essentially wrong. The perpetually tossing head arises from the fevered state of the poor animal, and his consequent attempts to get rid of an irritating infliction, and not from the vulgar idea of a fiery wish to be put in action. Of this I am certain, that the less artificial constraint you put into a horse's mouth the better. The less you encumber his graceful limbs with lumber in the shape of harness the better. The freer you keep his limbs and his respiratory organs the longer he will serve you, and the greater will be the labour he will perform for you.—*The Hon. Grantley F. Berkeley.*

ROUGH SKETCHES FROM THE HEBRIDES.

IN THE LEWS.

BY AN ENGLISH LADY.

MILE beyond mile of undulating expanse of peat-bog, overgrown with saturated moss and grasses that wave mournfully in the wind, and brighten to reddish gold in the fitful gleams of sunlight. Gray, scattered, fantastic masses of rock everywhere push their barren summits up through the black dank peat and scant herbage, where here and there spring isolated tufts of purple heather, or of the delicate pink variety with its pale swaying bells. Everywhere the earth is moist, and gleaming with dark, peat-stained, stagnant water. Noisy brooklets and trout-streams run sparkling in their winding course, now foaming over loose rocks and pebbles, now flowing silently between miniature cliffs and chasms of gray cold granite, and now gliding through the half-liquid bogs, piled with their many peat-stacks. Tiny lochs or tarns nestle in every hollow and at the foot of every crag, gleaming white and cold wherever the eye may rest, and glancing far away to the horizon; or their many waters, lashed to fury by the wind, which drives and whistles pitilessly over the sterile land, break in foam-crested waves and clouds of spray on their stony mimic shores. Not a tree to be seen; not a shrub, not a flower. At long uncertain intervals are a few groups of wretched, beehive-shaped, straw-thatched huts, many of them windowless, most chimneyless; a solitary farmhouse, surrounded by scant strips and patches of cultivation; a lonely school-house. In the faint far distance, pale and blurred and purple against the mist-hung horizon, rise range beyond range of the lofty Harris Hills. Save for the moaning of the wind and the dull thud of the Atlantic breaking on the shore, which is dimly discernible in the near distance, an absolute silence reigns; for here no bees hum, no birds sing, and the occasional mournful cry of a sea-gull or curlew is the only reminder of the feathered race. A few small herds of sheep or West Highland cattle grazing the

sweet scanty grass, and tended by bare-legged children; and an occasional group of two or three women or girls carrying on their backs great baskets full of peat, are the only signs of life.

Looking at these girls, with their sweet, fair, wind-bronzed faces and tawny hair, their supple shapely limbs and picturesque dress, one wonders how their lives flow on from year to year in this wild land of desolation; and what can be the sensations, events, and interests that fill up their lives, passed so far away from the din and turmoil of cities, and suffice to satisfy their minds and hearts. How perfectly these beautiful girls harmonise with their wild surroundings and stormy wind-blown skies. The rare gleams of sunshine glance in the blue of their eyes, deepen the rich glowing red of their cheeks and lips, and glorify the tawny gold of their hair, seeming to pour out upon them the sun's love as well as his light and warmth. The wild wind that wakes the sea to snow-crested beauty; that whirls over the treeless tracts of gold-tipped grass, low bent beneath its breath; that drives the massy clouds faster and faster through the changing sky, for ever renewing the shadows that chase across the mountains, striking in infinite variety the chords and harmonies of each exquisite tint and colour, now darkening the blue to purple and gray, now brightening the brown to rose, the green to gold: this wild northern wind seems to claim these girls for its own, and lends its aid to increase their simple beauty, for it wraps them in its rude embrace till their graceful limbs stand sculptured beneath the short, dark-blue clinging petticoat against the dull blue background of the hills and skies, the moving folds of their short skirts leaving bare the symmetry of their limbs and well-turned feet and ankles. The very baskets, peat-laden, which hang suspended from their shoulders by a belt of plaited straw, which is passed round their chests, add richness of tone and picturesqueness of outline to them and to the rugged landscape behind them.

The fiery beam the sun sent earthwards to tinge the hills and the grass with a fleeting radiance,

and to convert the innumerable lochs into seeming bits of bluest sky, is dying out; the gray clouds gather closer and hang lower, blotting out the distant heights; and the wind whistles shriller, and brings with it driving, drenching, blinding sheets of mountain mist. Two women walking fast beneath the burden of their peat-filled creels grow fainter; the red of their head-kerchiefs and the blue of their skirts melt away into the blurred distance and disappear. The surge bents angrily on the rain-washed shore; the whole dreary island is a uniform gray, without form, and void, seeming only to hold a place on the earth at all in the likeness of a dim shrouded ghost.

A bare-headed, half-naked little child runs by me, its small feet pattering over the sodden ground, its little rosy face washed clean. I stop it and ask the way to some shelter, for all sign of huts has disappeared. The mite looks at me with big perplexed blue eyes; one hand finds the way to its mouth, the other to its head; it speaks no English; so I smile and nod good-bye, and on it trots, the bare pink legs and arms gleaming in the wet; and I follow along the dripping road till the little figure turns into a low dark doorway, and I enter close behind. The darkness is so great within, that for a minute or two I can see nothing, but soon the ruddy glow from the peat-fire illumines the room and its occupants. I am in a long, tolerably lofty shed, whose slanting roof is thatched with straw fastened down by ropes, to which are attached heavy stones. There is a double thickness of wall, the inner of peat mud, the outer of large, loosely piled stones, on the top of which grow grass and moss, forming a narrow grassy path round the building (if it can be called such), just below the sloping roof. There are neither windows nor chimney, the smoke from the fire finding an escape through various holes in the remarkably well-ventilated roof, through which the continuous drizzling rain is freely entering, making little pools all over the smooth-frodden mud floor. The shed is divided into two parts, the smaller end being the common sleeping-room, and the larger being appropriated as general house-place by the whole family, which comprises two cows, two sheep, and a score of ducks, and hens, and chickens, the latter clucking and pecking all about the floor in company with several small children and a baby. The door and the position of the fire make a rude division between the biped and quadruped occupants of the establishment.

As I stand wet and forlorn in the doorway, looking in, a woman rises from a wooden bench in a dark corner, and comes towards me, inviting me to enter and take shelter in a soft musical voice. She is very tall and slight; and in the flickering brightness of the firelight I see that she is handsome, with a dark gentle face and large soft eyes. I see also that she is weeping, and at the same time I hear a stifled sob from some hidden region in the darkness beyond. Murmuring an apology for my

evidently ill-timed intrusion, I am turning to go, when the woman lays her hand on my arm, and says: 'It is raining ferry heavily; you had better stay whatever.' I hesitate still, not wishing to intrude on any private trouble, but a gentle 'You are welcome,' decides me to take a seat on the bench. A broad iron pan or 'girdle' is suspended over the fire from a hook fastened into the roof, and on it is a large oat-cake baking. I am very hungry as well as cold and wet, which sensation is perhaps visible in my face as my eyes rest on the crisply browning cake, for a girl, with tawny hair and brown eyes that have evidently not long been free of tears, rises from an opposite corner and brings me a large piece of the oat-cake from the pan; and while I am gratefully eating it, at a sign from the elder woman, she goes to the other end of the shed and returns in a minute with a glass of milk.

'You are in trouble?' I say presently, gently arresting the woman's attention by laying my hand on hers, as my ear catches another stifled sob from the room beyond.

'Yes,' she answers, wiping her eyes; 'it is in the herring-fishery. Seven of our lews men haf not been heard of whatever; there haf been awful storms here, and off the coast by Aberdeen, and seven men haf not come back at all. One of them wass my daughter's kaddie; and to-day it is she wass to haf gone home to him in Stornoway as his married wife, and now'— And she hid her face and wept, but continued presently: 'My own boy wass to the fishing, but he, thank the dear Lord, is safe whatever.'

I had heard of those storms and of those missing men; and as I thought of the poor young girl and her sad wedding-day, and heard her subdued sobs from the sleeping-place, I felt inclined to weep too. The child whose pattering little feet had led me to this shelter came towards me with puzzled wide blue eyes, and pulling at my dress, held up to my mouth a piece of oat-cake, as though eating were a panacea for all woes; and at the same time the baby, who, tired of rolling about with the chickens, had wandered to the other side of the fire, and got turned over by an amiable sheep possessed of an equally inquiring mind, which had come up to take a look at the stranger, set up a most dismal and prosaic howl. His mother dried her eyes and sprang after him, sending the too adventurous sheep bawling away; and in her motherly indignation that her baby should have been treated so, set to work scolding and cutting the children all round, till all was confusion and babel. Under cover of the general excitement, and feeling myself in the way, I stooped down and kissed the boy at my knee, slipped a florin into his chubby hand, said good-bye to the pretty girl who had spoken to me, thanked the mother, as she paused an instant to take breath, and left the hut, vehemently shaking my garments, and offering an inward prayer that I might be leaving that hut alone, as I entered it. The

rain has ceased now, and the mists are slowly rising. Before going away, I cannot resist the temptation of peeping through the rude hole which forms the bedroom window. What a sleeping-place for a large family! No table nor chair, no carpet, no hanging of any sort, no convenience for washing. A plank supported on two stones; two beds let into the wall like ship-berths, and covered with old patch-work quilts, under which I can see the frayed edge of a dirty blanket; and a small square of distorting mirror nailed to the wall, compose the entire furniture of the room. On one of these rude beds lies a girl with her face turned to the wall. I can see she is not asleep by the convulsive heaving of her breast; her hair is loose, and is hanging bright and long over the faded old coverlet. I can just see the outer half of a brown eyebrow, a large tear-swelled lid, and long thick brown lashes; a rather thin but finely moulded curve of cheek and chin; a small ear, and the long line of the sun-burnt throat, with the snowy neck below; a red handkerchief lies loosely above the waving hair, and the dark-blue petticoat is short enough to let me see the round brown limbs and pretty feet. Between her hands lies an open Bible. Poor child! She is very young to suffer so, but fortunately Time heals most wounds; and perhaps some day she will find happiness with some other fisher-lad, and will live to make his simple home bright and to hear his children call her mother. I go away picking my way through the slushy road, with my heart heavy for those I am leaving behind, and thinking pitifully of the many dangers encountered by the men who ply their perilous trade on the storm-tossed waters of the Hebrides; and when again I see the 'caller herrin' I shall know why

Wives and mithers maist despairin'
Ca' them *lives o' men*.

Not an hour since I had been wondering vaguely what could be the interests, pains, and pleasures that serve to fill the lives of the women who live in this desolate dreary land; and now I feel that I have indeed been answered. This little tragely is as a wide open door through and by which I can see down a long vista of simple joys and sorrows, terrors, anxieties, happy endings to long suspense, tragic death-blows to hope, tender love, and domestic happiness. I see now that buried away though they are from the great outer world, with its strugglings and strivings, successes and failures, affluence and misery, still they cannot cut themselves adrift from humanity, but must bear the cross or reap the blessing in common brotherhood with all human lives.

I walk on past Garrynahine with its pretty hotel, principally resorted to by lovers of the gentle art; past the lovely loch that lies at the foot of high rugged hills, and looks towards the open sea with its deep-blue glance, on along the bog-bordered road for two miles to the old 'Druidical temple' of Turnachan Callernish (the place of pilgrimage on the Bleak Headland), where it stands on a grassy rising peat-knoll commanding a wide view of sea, lake, and mountain. These giant stones stand in the form of a long shafted irregular cross, branching from the four sides of a double circle, within the inner of which is a rude kind of altar sunk in the ground. Until the year of the famine they were

raised only three or four feet above the ground, and then, in order to provide employment for the starving inhabitants, Sir James Matheson, the owner of the entire island, had the surrounding peat cut away to the depth of thirteen feet, the tallest stones being now seventeen feet above the peat. Their effect is most imposing and weird, rising fantastic, tall, and gray from the green-clad peat; and seen by moonlight it must require a very slight stretch of fancy to imagine them the grayly draped, majestic forms of the ancient Druid priests, standing there stiff and motionless as frozen stone, keeping a jealous watch for ever, over the dreary land where they once held sway and where they worshipped their ancient gods. The wild wind murmurs and whistles, and moans round and through them, and the shifting shadows thrown by the masses of scudding rain-clouds play over and about them till they seem to be swaying, and turning, and whispering in a strange unknown tongue.

At last I leave them behind me, and retrace my steps on past Garrynahine, with its wild lone beauty, past the barefooted children that have followed me from their various beehives; past the little manse, and the school, and the doctor's house, back through mile after mile of loch-studded boglands; past the little mound, surmounted by its cairn of stones, where tradition tells of a foul murder committed; back past the spot where a skeleton was found in the bog; past the islanded loch where two girls were drowned whilst resting from carrying their peat-creeks; back and on, while the mist descends more densely than ever, sweeping heavily across the skies, and the hills, and the grass, and blots out me and the dreary landscape together.

THE ARAB WIFE

A TALE OF THE POLYNESIAN SEAS.

CHAPTER X.—APOSTASY.

WHEN I awoke from my fainting-fit, my head was pillowed on the lap of Fatima, who was bathing my wounds. The wives of Nizam were present; and on looking round I found that I was actually in the zenana, probably in Fatima's room. Fatima was unveiled, but the others were so swathed that I could only see their large dark eyes. I did not know exactly what had passed or was passing; but soon I remembered, and despite the presence of the veiled females, I flung my arms around Fatima, who returned my embrace with equal ardour.

Nizam made his appearance. 'It is death by our law for a Christian to see an Arab girl unveiled.'

For the life of me I could only respond stupidly: 'Is it?'

'You have seen Fatima unveiled. What must be done to you?'

I replied stolidly: 'I must die, I suppose.' I remembered what he had said, but did not recall it to him, being too proud; but I looked it.

He said: 'Yes; I promised you life and my daughter, and I will keep my word; but the law must not be broken.'

Even then I was so stupid that I could not see what was coming.

He repeated: 'The law must not be broken. If a man who is not a believer look upon an Arab woman, he must die, or' (here he smiled at me) 'become a believer and marry her.' Having delivered this ultimatum, he smiled again, and beckoning to the veiled ladies, departed, leaving me alone with Fatima.

I was quite wide awake now, and observed that my fair companion was beaming with uncontrollable joy, and ready at a moment's notice to display her transports. Seeing that I looked bewildered and unhappy, she became seized with sudden timidity, and waited anxiously for what I might say.

'Fatima,' I commenced, 'I must die, or give up my religion.'

She glanced at me from under her beautiful long eyelashes, but said nothing. Never had she looked to greater advantage.

'Fatima,' I continued, passing my arm round her yielding waist, 'it is hard to die so young, especially when one is beloved; do you remember our first meeting?'

She never spoke, but gradually pressed closer to me, until her head was reclining on my shoulder and her breath fanned my cheek.

I went on: 'Do you remember how you told me of your mother, and how you wished to be a Christian, and besought me to teach you the tenets of your mother's faith?'

She never spoke, but her bosom heaved tumultuously; she encircled my neck with one arm, and with the other sought for my hand, which she pressed passionately.

I still continued: 'Do you remember how you promised to worship as I worshipped, to eat as I ate, to live as I lived, Fatima?'

Surely the wit of all her sex was in her at that moment. Had she entreated me, I would have insisted on being a martyr; had she prayed me with the tenderest words to obey her father, I am certain that I would have made fine speeches, and shouted to Nizam to take my head. But the girl was actuated by such a pure love for unworthy me, that instinctively she comprehended the danger of any opposition. Her tongue did not speak; but her eyes, her beauty, her pleading arms, spoke the sensations of her heart. She pressed her lips to mine suddenly with an ardour that astonished me, and sank back swooning, overcome by the vehemence of her emotions.

Feeling somehow that I was to blame for having thus wrought upon her susceptibilities, I strove to restore her to consciousness, and was rewarded with the most bewitching smile. I caught her, and pressed her in a transport of uncontrollable love to my heart, crying: 'Dear one, you said to me that you would worship at my shrine, and partake of my cup, and would be wholly mine, for love's sake. Now hear me say that since the Fates have ordained it, I will worship as you worship, and will partake of your cup, and will be wholly yours.'

I cannot depict the rapture that ensued. Far rather let me plead in extenuation of my apostasy, that I was very young, that I had never been properly imbued with religious feeling, that I was desperately in love, and that Fatima had completely humoured me by giving me no chance for

heroics, and by fanning to the utmost my tenderness for her.

Nizam entered shortly, whereupon Fatima coquettishly assumed her veil.

'Well, Feringhi, do you accept the conditions, and marry my daughter?'

'I do, Al Reis; and let me say that in giving me Fatima you bestow on me a jewel that I could never deserve were I to live a thousand years.'

'She is a pearl, a veritable Taj Mahal!' responded the gratified father. 'And she has made a convert to our faith, by which the whole household will inherit Paradise. My son, come with me, for I have much to say and to hear from you.'

I accompanied him to the little audience-room; and we sat there for many hours arranging the preliminaries of my new life. It was arranged that I should go on a cruise with Abou, accompanied by a Mohammedan teacher he had brought from Oman, and that instruction in the faith should be then imparted. Next he gave me the history of his adventures with the cargo, which he had sold to great advantage, my share coming to twenty thousand ashrats of gold. Then he questioned me as to the papers; and I gave him a list of Dutch words which I had compiled from them, but at the same time explained the impossibility of the task, and recommended opening the casket with a cold chisel. This, however, he would not hear of, but said we had a lifetime before us, and chance might favour us.

In my turn, I asked that I might have the writing-desk of the Dutch captain to keep the papers in; to which he cordially assented; and gave me besides whatever I might choose among his stores, or in the cabins of *The Shark*, for the fitting up of the pirogue, which he agreed should be named *Fatima*. We had the mid-day meal together, and parted on the most cordial terms, my conscience light as that of the lover who has obtained a father's consent.

I sought Abou and told him the news; whereupon my good old friend threw himself into my arms and embraced me so joyfully that it took away my breath. It was a purely unselfish delight, for Abou was Nizam's right-hand man, and might have been excused for feeling jealous; but he, on the contrary, felt the greatest pleasure at the news, and had an attachment for me of which I was unworthy, and which I fear I repaid after a poor fashion in the end. I told him Nizam's generous offer about fitting out the pirogue, and he promised to see after it all, and to bring the writing-desk on board as well. Released from these cares, I returned to Nizam's room, and consulted with him as to whether I might see Fatima during the few days that intervened before we set sail. But my future father-in-law explained that such a thing was perfectly impossible, not to be thought of for a moment, and that I would not see Fatima again until the moment of the marriage ceremony. He proposed, seeing disappointment in my face, that we should inaugurate a hunt after the Malays; but I pointed out to him that in the wood that stretched beyond the mountains, the arrows of the sumpitans would be more deadly than our pistols, and that the game was not worth hunting anyhow. So he dropped the idea, and left me to my own resources, which were extremely limited. Having nothing better to do, I whiled away the time by committing to memory, and afterwards copying in

Arabic writing, one of the poems of the Moullakat which Abdallah had recited to me; the third I think it is, about a love adventure of Antar. This, with stepping down a few times to the ruins of the Malay town to see after the Papuans, filled up the longest, slowest days I ever spent.

The Arabs waited until Friday, which is with them supposed to be specially lucky, and is indeed their Sabbath, though they make no difference between it and other days. On that auspicious day, *The Fatima* sailed on her first cruise, with myself as the nominal commander, though Abou had real charge, as indeed it was his vessel. The wind was from the north-east, which would have been bad for a proa, but *The Fatima* could sail within five points of the wind, and accordingly could get along by making a short tack and then a long one, which brought us satisfactorily out of the channel. Then we crowded all sail straight for the coast of Burmah and the Straits of Malacca.

The Fatima had one great advantage over the proas in her appearance; she looked like a French lugger, but was incomparably lighter, swifter, and more buoyant; and the spars were made of light material that would never break, and could be easily handled by two men. A crew of three could take *The Fatima* anywhere. She was flush-decked; and by battening down the hatches of the fore-cabin and the cabin, not a particle of water could get in; and we could defy a typhoon in the open ocean. We had a wheel to steer with; and the arrangements below for cooking and comfort were as great as in some merchant-vessels. Our capacity for stowing away cargo was considerable; and in short the pirogue was really worthy of the affection with which we regarded it.

We ran along under full sail, making extraordinary speed, and gliding along in a ghost-like sort of way. But the wind, which at first had been quite gentle, increased shortly after we lost sight of Celebes, and soon blew a regular gale. Our craft behaved delightfully, climbing up the waves and racing down them without effort, riding the water like a storm-bird. But the Papuans whom we brought to row the sweeps in case of a calm, by no means liked the look of things, and evidently thought we were crazy in not taking shelter under the volcanic islands that were far to leeward. But greatly to their horror, though the wind increased, we kept steadily on, until even the Arabs began to look a little white at matters. At last the man at the wheel left it, refusing to steer unless we changed our course and scudded before the wind. I took the helm myself, and ordered him and the others to go below and sleep. Abou seconding this, they retired, though evidently in great dudgeon. The wind went down towards evening; and when they came up again they were somewhat ashamed to find the vessel all right, the sea going down, and the sun setting in peaceful splendour.

Abou was steering, and Abdallah, who was with us, came up and complimented him upon the pirogue, which he owned was a perfect marvel. On the third day we sighted a square-rigged vessel, coming evidently from some port in Hindustan, and making for a Chinese harbour. The wind was light and variable, and only the lighter sails of the stranger were drawing, the heavy canvas

of the topsails and courses hanging idly against the masts. But *The Fatima's* sails being of fine material, except the foresail, which was of the strongest stuff we could find, drew splendidly, and we glided onward rapidly, nearing the ship in an oblique direction, as if we were steering for the Irrawadi.

I was lying on my carpet on the quarter-deck, and Abou issued directions, Abdallah acting as his second in command. We soon were within speaking distance, and the stranger hailed us: 'What ship is that?'

Abdallah nodded to me, and I shouted back: '*The Fatima* of Sarawak, bound to Bombay.'

'What's your cargo?'

'Palm-oil and seed-pearl.'

'Will you take letters to Bombay?'

'Yes, sir.'

'Then come on board.'

Both steersmen having the same intention, *The Fatima* glided alongside, and was secured at once to the ship. I stepped on board, for the adventure promised to be curious, and was welcomed by the captain, who told me his ship was the *Moulmein* of Bombay, bound to Canton with opium. He asked me to step into his cabin, and produced sherry and biscuits; but I excused myself on the ground of its being Ramadan, which indeed it was. If I had tasted anything, of course I must have spared them, which would have been false to my Arab friends, and ruin to all my selfish hopes.

The captain seemed surprised at my English; but I told him that I was born at Delhi, and had served in the Irregular Horse. While we were speaking, and he was complimenting my excellent English, there arose a tremendous yell and the sound of fierce fighting. He excused himself to me, and was about to rush out, when I tripped him up and told him he was a prisoner. He struggled fiercely; but I was too strong for him, and during the scuffle that ensued, he fell heavily on the cabin floor and became insensible.

Taking the precaution of binding him securely hand and foot, I emerged from the cabin with the captain's revolver, discharging the barrels as I came on, and slinging the pistol itself at the head of the chief-mate, a great raw-boned Scotchman. Before he could recover himself, I drew my canjeer with my left hand, gave an Arab yell, and charged the line of sailors who had formed near the fore-cabin. Being seconded by the pirates, I drove them into the fore-cabin, and then and there announced to them that if they would surrender, we would content ourselves with the cargo; but if they did not come out and submit to be tied, we would burn the ship.

Upon this they came out submissively and gave up their weapons, and being asked if they would help in unloading, they said they would; so we did not tie them. The opium was in large whitish balls about the size of a Dutch cheese. It was not packed in boxes, but loose; so that the more hands we had the better. In consideration of this assistance, we did not plunder the fore-cabin, but ransacked thoroughly the cabins. I secured a chronometer, thermometer, barometer, quadrant, and set of charts, which I had wanted badly. There was a little money, but so little, that I thought it belonged to the captain, and so left it where I found it. But we took cooking

utensils, table-cloths, a sofa, a table, and the square big hammock of the captain; and then, finding that there was not much more to take, we bade them farewell, having loaded with as much opium as we could conveniently stow, though more than half remained in the vessel's hold.

Abou, Abdallah, and I then held a council of war as to what should be done. We were then steering for the Straits of Malacca, and going none the worse, it seemed, for our heavy cargo.

Abdallah remarked: 'If we get back to Gezireh with opium, we shall not get thanks from Nizam.'

'Well, bnt,' I replied, 'this is Abou's boat, and Nizam only gets a share as chief. And Nizam can take it to Bishire or Mohammedah, or even Bombay, if it comes to that, in *The Shark*, and dispose of it there.'

Abou said: 'Can't we sell it ourselves?'

'Of course we can,' cried Abdallah. 'Let us go to Shin' (China).

The idea was not a bad one. And our course was altered accordingly. The vessel we had plundered soon spied us coming back, and evidently imagined we were going to make another attack, perhaps for the sake of completing the plunder. We could see them busily wetting their sails, and doing their utmost to get away; but we passed them peaceably, the pirogue going wonderfully fast in light winds.

Soon the wind increased a little, not enough for a square-rigged vessel, but just enough to allow *The Fatima* to shew her best pace; and we made a quick passage without adventure to the mouth of the Canton Harbour, or, as it is called, the Boco Tigris. Numerous pilot-boats came out and wanted to take us up, but we steadily refused, without giving any reason for our conduct. The fourth pilot was not so readily repulsed. He put his finger to the side of his nose: 'Me sавce youce pigeon.'

'What do you say?'

'Me sавce whatee got shippee; no papers gottee, opium gottee; all same me pigeon.'

I nodded assent.

He chuckled. 'Wait piecee. I go bring gentleman fixce you pigeon.' Saying this he darted into his boat and made for shore.

Abdallah and Abou were very curious as to what had passed, and I explained, and added what I had heard at mess, that opium was not a legal commodity in China, and that it had to be smuggled in.

Before nightfall we were hailed by a long rakish junk, rowed by a great many oars, that came down the stream with marvellous speed. From this craft we were boarded by an American, who offered us so many taels for all the opium we had on board, assuring us that he would run it through on his own responsibility and with his own craft. He certainly looked at our vessel with surprise, but he asked no questions.

I consulted with my friends, who said that we had better not take Chinese silver, if we could get American or German; so I asked him if he would mind paying in dollars. 'Not the least,' he said; in fact, he preferred it.

So we accompanied his junk to a small island behind Macao, the Portuguese settlement, where the transfer was made in four trips; and departed with a very handsome sum in bright silver. Inflated with this lucky venture, Abdallah wanted to

continue the cruise, but I reminded him that there was somebody waiting for me in Gezireh who would not thank them for prolonging my absence.

This argument was conclusive; and we returned to Gezireh, my instruction in the Mohammedan faith having, I fear, been sadly neglected!

SINGING ROUND THE WORLD.

CONCLUDING PAPER.

To finish off their musical excursion in the southern hemisphere, the Kennedies visited New Zealand, which involved a sea-voyage of some fourteen hundred miles from Melbourne. The power and quality of the steamers render this not a difficult undertaking. The passage was, however, rough; and at the end of three days it was a relief to come in sight of the towering peaks of the middle island of New Zealand. The landing was at Port Chalmers, in Otago, from which a railway-train speedily took the party to Dunedin. This thriving modern town, which dates no farther back than 1818, appeared to rise 'in a grand amphitheatre at the head of the harbour, with a picturesque lofty background of bush-covered heights. The town seemed a great wave of streets washed up against the hills, with houses dispersed like spray among the wooded hollows around.'

As Dunedin was settled mostly by Scotch, the Kennedies had arrived in the midst of a population ready to give them a hearty reception. They sang the songs of the old country to delighted audiences. People vied to be acquainted with them. They had consequently opportunities of acquiring a good knowledge of the place. Their concerts lasted five weeks, ending in Burns's birthday, January 25, 1871—a long time, considering the size of the town; but one peculiarity of the colonies is, that public entertainments run longer than in England or Scotland, because, as we presume, the novelty is greater. The party were struck with the prevalent air of industry and substantial wealth. 'Many of the early settlers are now in the character of successful merchants, and have retired, or are retiring, in favour of their descendants. The shopkeepers are all in a steady way of business. As to the working classes, they are in a land of plenty. Every man can clothe, feed, and educate his family, and have something to spare.' From the comparative scarcity of labour, wages are high. Domestic servants 'can save money and dress handsomely.' But that, we beg to say, they can generally do at home if they have a mind. It is gratifying to have the evidence of Mr Kennedy that no poor people are to be seen in Dunedin. 'There is,' he says, 'none of that poverty verging on starvation which is so painful to see and hear of at home.' Doubtless, one reason for this agreeable state of things is that the foul demon intemperance has not yet eaten into the vitals of the community.

The party spent six weeks in travelling through Otago. As the province is as yet provided only

in a partial way with railways, the dependence was on 'a red-bodied, yellow-wheeled coach, with a staunch-looking team of four horses,' furnished by a coach proprietor, who likewise provided a careful driver. At Tiapeka, the oldest gold-field in the province, they found a large number of well-dressed Chinese, walking about with their fashionably attired English wives, and who had apparently a relish for singing. At the concerts, they invariably occupied the very front of the front seats. Occasionally, the party encountered immigrants who, being unsuitable, ought not to have left home. 'One day a man was mourning the lack of employment, but he turned out to be a glass-eye maker!'

At a place called Popotunoa, they were the guests of a hospitable clergyman, and to help his infant church, they gave a concert, the only eligible hall for the entertainment being the barn of a neighbouring sheep-station. Everything was very primitive. 'The seats were planks laid upon bags of grain, and an open loft with sacks of chaff served as a gallery. On the platform, which was a few boards covered with carpets, stood a table with a globe-lamp, and on our small travelling piano bloomed a neat bouquet of flowers. The audience soon assembled. We saw the folks coming across the moorland, through the long grass—men, women, lads, lasses, mothers, children, shepherds, servants, and people on horseback. Every shepherd brought his "collie" with him, so that the barn swarmed with dogs. The horses were tied outside. The barn was not brilliantly lighted. Chandeliers were made of crossed pieces of wood, each with two holes, into which candles were placed.' As the chandeliers were neither level nor very steady, some inconveniences were experienced, but trifles are not minded in matters of this kind, and the concert gave unqualified satisfaction. The only untoward event was the howling of one of the shepherd's dogs, which got its head accidentally jammed in a round cat-hole in the door—the yell it set up coming in awkwardly during the pathetic singing of the 'Land o' the Leal.'

The party at length got to Invercargill, which has now a railway reaching to a port at which steamers arrive from Melbourne. Thence they went to Winton, where, by permission of the inhabitants, they gave a concert in the schoolroom. In the course of their travels they reached Christchurch, the capital of Canterbury. Here, though mainly settled by English, the Scottish songs were as highly relished as in Dunedin. Wellington, Auckland, and a number of other places were successively visited. Often the roads were so bad that some suffering was experienced; but on the whole, the party, who took things philosophically, enjoyed themselves, and were pleased with their musical success. Of the magnificent scenery and geological phenomena there are pretty full accounts, but though passages are well worth quoting, we pass them over for want of space.

The Kennedies left New Zealand with deep

regret; their last words being, that they shall never look on its like again! Their object was next to visit San Francisco; but to do so, they had to go a long way round about. First, they went to Melbourne, and then to Sydney, whence, in June 1875, they proceeded in a steamer which had to call at Auckland. Looking at a map, it will be seen that the voyage from Auckland in a northerly direction is right through the groups of small islands which dot the Pacific Ocean, and that the Sandwich Islands are situated in the route to California. The vessel in which were the party of Scottish vocalists had a delightful run to Honolulu, the capital of Hawaii. 'All was sunshine and pleasure. A meeting was held in the saloon, and an entertainment committee elected, which subdivided itself into a concert-programme committee and a dance committee. During the day of the concert the programme was tacked up outside the cabin, with such notices as "Boats and life-buoys may be ordered at ten." The entertainments were held sometimes in the saloon and sometimes on deck, according to the temperature. Nearly all the passengers could sing, and our little piano was brought out of the hold for the occasion. Like the concerts, the dances were a great feature.' As in all English sea-going vessels, Sunday was kept with due reverence. Morning service was held in the cabin. The captain read the Litany, the purser officiated as clerk, and a good choir was organised among the passengers. The trip from Auckland to the Sandwich Islands occupied sixteen days; the thermometer at no time standing at more than eighty-three degrees. Time went swiftly on, and the Kennedies look back on this as a bright spot in their lives. The vessel remained at Honolulu only a day or two to take on fresh passengers, and then proceeded on the voyage to San Francisco. The journey from Australia by way of Honolulu and San Francisco is fast rising in favour, but it is expensive, as in the circumstances it can hardly fail to be. In thirty-one days in all from Sydney, the party of Scottish vocalists arrived at San Francisco, ready for the excursion across America from the Pacific to the Atlantic.

Plunged into the whirl of affairs in California, the party visited various places at which there are monster hotels, of which we have some amusing descriptions. Then, they went off eastward by the cars, taking Salt Lake City, the capital of Mormondom, by the way. Pushing along amidst all the imposing scenery of the Rocky Mountains, the party are sufficiently shocked with the relentless spirit of American advertising. The grandest points to be admired are stuck over with pulls in huge letters of some article recommended to purchasers. 'Admiring a high peak, our eyes rested on "Dyspepsia Pills"—falling into raptures over a deep ravine, we were shocked with "Vinegar Bitters"—meditating on the grand vista of precipices, we were told nothing equalled the "Patent Horse Oil"—and while noting the beautiful effects of light and shade, we were suddenly

called upon to "Try the Rising Sun Polish." Business has robbed even the Rocky Mountains of romance. The train, too, has its vagaries. Going steadily along a rolling prairie at the modest pace of twenty miles an hour, there is suddenly an incomprehensible stop. The engine-driver leaps off, with a tin can in his hand, and makes a "bee-line" for some spot on the nearer rising ground; the conductor follows him in double-quick time. Then, from out the long stretch of cars swarms an eager crowd of passengers, armed with bottles, pannikins, jugs, tumblers; and snatching up a cup, we stumble and dash over the hollow and knoll, till we join the throng that gathers round the centre of attraction—a soda spring! The demand for drinks in a dry and exhausting atmosphere is overpowering. Every train carries cans of water for the passengers, and the temptations presented by a soda spring are of course irresistible.

The party turn aside to visit Chicago. The throng in the Bunkum Hotel was awful. In the dining-hall no fewer than three hundred persons. The waiters bring what is ordered by the guests: 'Involuntarily we hear the order given by a gentleman sitting near us—"Bring me fried smelt, roast-mutton and jelly, keff head, pork and beans, squash, mashed turnips, boiled rice, tomatoes, potatoes, and a cup of coffee!"—the lady beside him adding: "The same for me!"' At these dinners there is a large consumption of ice, in the use of which the Americans are proficient. From experience, we can testify to this, as also to the commendable feature, the almost entire absence of beer, wine, or spirits in the dinners at American hotels, where any drinking of alcoholic liquors takes place separately in the bar or general lounging-room. There is no difficulty in either getting to or departing from Chicago, for two hundred and fifty trains arrive and leave every day. By one of these the party proceeded to Detroit on the St Clair River, and were ferried across, locomotive, train, and all, to the Canadian shore. Once more in British territory, the Kennedies felt at home, and there was before them no end of singing if they liked to pursue it illimitably. Travellers in Canada must reckon on the vicissitudes of climate. We can remember the alarm we experienced at London, not far from the river St Clair, when the snow began to fall on the first of November. At the same place the party of vocalists awoke on the last day of October and saw the ground white with snow. Winter is no doubt a jolly time in Canada, but not always satisfactory to those who have to travel to distant places in the midst of a snow-storm. Still, by means of sleighs, on one of which the little piano was securely fastened, the party prosecuted their singing operations. Defying weather, and with prodigious pluck and animal spirits, they laughed and sang their way through the country. At last, in sleighing from Listowel to Wingham, they encountered a somewhat sobering misadventure. We let the writer of the volume tell the story in his own way.

'This day we had to travel twenty-two miles. The thermometer stood twenty degrees below zero—a gale was blowing right in our teeth—a fierce snow-storm was raging—and altogether it looked as wild a day as could be imagined. Not a soul was out that could possibly keep indoors. The

snow was drifting and falling rapidly, all tracks of vehicles had been obliterated, and we had to plough slowly along. The horses struggled amongst the great mounds of frosty, powdery snow. Dense wreaths swept along the road; and though our two vehicles were only three yards apart, yet we were continually losing sight of each other. We were driving in a white night. The cold was awfully bitter. The foam hung from the horses' nostrils in long white icicles. The lapels of our greatcoats were frozen as hard as a board, and our cheeks were glazed with scales of ice. We were completely white with snow, like human statues. My brother, who sat alongside of me, had two blobs of ice on his eyes, like ice-spectacles, and he could not see till, after some difficulty, he got them picked off. Then his left cheek became white—he was frost-bitten! Snatching up a handful of snow from the buffalo robe, I vigorously rubbed his face till the blood began to circulate. All at once he cried: "Look at your nose!" but as that was rather a difficult feat in optics, I replied: "What's the matter?" And he said: "It's as white as anything!" So I excitedly rubbed my nose, or rather the place my nose used to be, for I could not feel it. Then my brother's cheek blanched again, and I applied more snow—after which my nose became marble, and it had to be polished once more. Then his cheek, then my nose—nose, cheek, nose, cheek, nose—till a natural hue had set in. At length we reached a small hotel, and though only four miles from our destination, yet we all ran in and warmed ourselves at a stove—all, except my brother and I, who had been frost-bitten. It is not considered safe to trust yourself near a fire after such an occurrence, as then a swollen ear or nose is apt to remain a big ear or nose always, or turn into an open sore for the winter. Therefore, to avoid such a fate, we two remained in the dreary cold outside, tramping back and forward to keep some life in our feet. But as the horses ran a risk of getting chilled, we soon started, and arrived in Wingham. The driver vowed he "wouldn't go through the same again—no, not for a hundred dollars." It is related that a Scottish Canadian, on his voyage home to Scotland one summer, was found sleeping on deck by the captain, who roused him with a caution against sunstroke. "Sunstroke!" replied the Scotsman, with ineffable scorn; "it wad tak a' the sun atween here an' Greenock to thaw the Canada frost oot o' my head!" And we could almost say it took a week to thaw out the awful cold of this journey, though, with the exception of some little scars, we were none the worse for our frost-bite.

The description given of the musical excursion through Canada excites the most agreeable emotions. The party sang in every town, large and small, sometimes in villages that could in themselves have scarcely furnished an audience. One evening an old Scotsman drove forty miles to be present. On being shewn into the side-room, he seized Mr Kennedy's hand, saying warmly: 'I dinna care sae muckle for your sangs—I just want to see a man that has seen Perth since I saw it!' It is mentioned that the old farmers were much affected by the songs. Frequently they would break out, in their enthusiasm, into loud comments. One night, at the conclusion of Hogg's song, 'When the kye comes hame,' a man slapped his knee, and

exclaimed with a burst of enthusiasm: 'That's meat and drink to me!'

In January 1876 the party were in Montreal, and as a matter of course were honoured with an invitation from the St Andrew's Society to a banquet on Burns's anniversary. They went, and were pleased with their reception. 'The Society is of a charitable nature, and the president gave some striking anecdotes of the good it had done to poor deserving Scotsmen in Montreal. On a subsequent occasion he took us through the St Andrew's Home, a well-kept institution, where the needy are supplied with food in the winter, and where Scottish immigrants are housed till they find employment. In one of the rooms there lately died a nephew of Sir Walter Scott'—probably one of Thomas's sons, an unfortunate Torturation. The banquet, we are told, was carried on with great glee. At its conclusion a procession was formed, and the Kennedies were escorted to the hotel in grand style, accompanied by strains on the bagpipe.

From Montreal to Quebec, and so on to New Brunswick and Nova Scotia, the Kennedies did not slacken in their singing till they were on the shore of the Atlantic. They had literally sung from sea to sea, across a space of three thousand miles. As if that was not enough, they shipped for St John's, Newfoundland, and there finished their musical career. For some reason not explained their little piano was not available. This led to a difficulty not devoid of amusement. 'We had some difficulty and much fun in getting a piano for the hall here. In the first place, we called on a music-seller, who shewed us a cottage-piano half a tone flat. "I had to lower it," said he, "for some young ladies who sung at a local concert." The piano, we were told, would have to be taken out of the first-story window. Last time it was moved he had to saw off the banisters of the stairs, but that came to be troublesome and expensive. He dealt chiefly now in pianettes. "The fact is," said he, "the doors and stairs are so narrow that collins and pianos have to be taken in and out of the windows." We found there were only two "grands" in the island—one at Harbour Grace and one at Mr B's, to whom accordingly we went. It was an ancient, highly carved instrument, with sonorous bass, but "tink-a-tanky" upper notes. Off next to see the piano of Mrs C., a widow, whom we surprised in the act of cleaning house. O yes; she had a "cottage"—and it was the most "cottagey" piano we ever saw, for the back of it rose almost as high as the ceiling. "It's rather out of tune," remarked Mrs C.; so we struck A to test it with our "fork," but the key gave no sound. "Just what I said," she exclaimed—"some of the notes are out of tune altogether."

Before quitting Newfoundland, the party made some excursions amongst the picturesque hills that overlook the harbour of St John's. A rapid voyage of seven days by steamer brought them to Liverpool; and soon afterwards they were settled in their dwelling in the southern suburbs of Edinburgh, as if they had only left it yesterday, and as if four years of singing round the world and seeing many distant lands were but a dream. Recommending the book* to the perusal of those

who take an interest in excursions such as are described, we only say in conclusion, See what can be done by persevering industry and intelligent enterprise to make the most of talents and opportunities!

W. C.

MY AUNT'S ATTENDANT.

I was supposed to have arrived at years of discretion, and in fact ought to have done so, as I was three-and-twenty when the circumstances which I am about to relate took place. But years do not always bring wisdom, and even some rather sharp experiences had failed to make me wise, for notwithstanding a very fair patrimony and my prospects as a barrister *in futuro*, I one fine morning awoke to the fact that I was in debt; a disagreeable dun was pursuing me pertinaciously, and I had not the means of satisfying his demands. Hitherto, I had torn up his letters and laughed at his threats; but a certain printed document presented personally to myself altered matters. Something must be done, and done quickly.

Money was imperative. I was not sufficiently hardened to contemplate applying to my intimate friends for a loan—the very sound of the word had an objectionable ring in it, and I had already overdrawn my banking account; consequently this pressing necessity for immediate funds was rather a painful position. I had to consider the question well before any conclusion could be arrived at. I thought over every plan and project, rejecting one after another as unfeasible, until at last a bright inspiration seized me. I had an aunt, an old lady, whom from my childhood I had been taught to hold in great awe, for she was not an ordinary aunt, but one to be considered and consulted, and not to offend or displease.

Aunt Dorothy Vyvian had been impressed upon us as one of the articles of our religion ever since I could remember. Aunt Dorothy had never been married, and she possessed in her own right a nice little fortune, securely invested, which gave her over a thousand a year. That will explain why Aunt Dorothy was not to be considered quite an ordinary aunt. I had been fortunate enough to be her god-son; so, in addition to the claim of consanguinity, had some grounds for supposing I was sure to be substantially remembered when the melancholy period of her death should arrive. She had a comfortable house in London, to which, as children, I and my two elder brothers occasionally were invited; and during those somewhat rare visits, the pressure we had to put upon ourselves to repress our juvenile spirits was something too great to be easily forgotten—for Aunt Dorothy abhorred riotous boys; whatever we did at home, we must beware how we let our voices be heard in her house. So thoroughly were we impressed with a wholesome dread of her, that we managed to pass muster in her opinion for three uncommonly good quiet boys, and her praise of myself in particular was regarded by our expectant parents as of most satisfactory augury.

But, as may be imagined, our good behaviour was kept exclusively for my Aunt Dorothy's awful presence. Whenever she was safely deposited within her small chocolate-coloured brougham, and had started for her triple turn right round the Park, an exercise she seldom or never missed, we boys would break forth, and the orderly drawing-

* Kennedy's *Colonial Travel*, a post-octavo volume, 1876.

room for the moment became, according to our old nurse's phraseology, 'like Bedlam broke loose,' until one of us spied the old coachman and the white horse approaching, when books were closed, booby-traps scattered, sofa-pillows restored to their legitimate resting-places, with such celerity, that before she had time to alight not a trace was left of the racket in which we had indulged in her absence.

On one occasion, however, a slight accident happened which had caused our hearts to jump into our mouths, and our very hair to stand on end. She had a favourite clock, a small but very perfect Dresden one; and during one of our riots, Charley, my eldest brother, knocked it from its pedestal: it fell fortunately on to a sofa which, by a lucky chance, happened to be under it, otherwise nothing could have saved it from being totally smashed. We stood aghast; our merriment came to a sudden conclusion; and we gazed for a moment with speechless horror at the delicate china article, fully believing that the first touch, however gentle, would cause it to fall into fragments. No time was to be lost, and we summoned up sufficient courage at last to lift it up and examine it. To our great joy, no damage was visible; not even Aunt Dorothy's keen eyes could detect what, after a very minute investigation, we discovered, a very minute chip off one of the china asters which adorned the base of it. It really was not an atom the worse, and even if it had been, we were far too afraid of her to muster up courage to confess. So we replaced the clock upon its velvet bracket with trembling fingers, and watched it with intense anxiety, expecting every moment that it would stop from some unseen internal injury; but it ticked on quite merrily, and we breathed again.

That was years and years ago. What changes and chances had come and gone since then! Yet how well I remember those days. How happy we were too. Aunt Dorothy did not seem to have grown much older: I could never imagine she had ever been young at all. She seemed to me a sort of evergreen that would remain an evergreen to the end of the chapter.

My brothers both went to India; my old home was not; and I had come to settle permanently in London. Excepting those absent brothers, the only person with whom I could claim kith or kin was Aunt Dorothy. So when I was in the above related strait for ready-money, it was not unnatural that her abundance should recur to me. It would all be mine some day: she had once or twice let fall as much; surely she could not object to giving me a little now. The more I thought of it the more feasible grew the idea; and I had almost made up my mind to go boldly and state my case to her; but I suddenly remembered, when my courage was quite up to the sticking-point and I had in fact fully decided, that Aunt Dorothy did not live alone—she had an attendant. This attendant, whose name was Mabel Turnour, had come to her not very long before in the capacity of maid, but had by degrees risen to the position of a regular companion, though my aunt invariably alluded to her as 'My attendant.'

My attendant was not more than four or five and twenty; her figure was of medium height, perfectly proportioned, and her face was one of the fairest I had ever seen. She had, from the plain attire of a domestic, gradually been emboldened to

assume in a small way the silks and even jewellery of her mistress's rank, although she had sufficient sense and taste to confine herself to quiet colours; and notwithstanding the humbleness of her real position, a more ladylike and refined-looking person could hardly have been found. She was wonderfully devoted to my aunt; at least so the latter informed me; and I never went to the house that I did not hear of some fresh perfection that had been discovered in this *rara avis*, Mabel Turnour.

It never occurred to me to be uneasy as to the chances of her coming between my aunt and me; so no feelings of that kind accounted for the dislike with which almost from the very first I regarded this girl. It was more an instinctive than an acknowledged aversion; and I was fully aware that my unfriendly sensations were thoroughly known to Miss Turnour; in fact under the guise of civility we hated each other. She was always sitting with my aunt when I called, consequently I knew a visit upon such an errand as mine would be useless; for how could I broach the subject of the loan in the presence of a third person: it was impossible. So mature deliberation decided me at last—I would write.

It was the pleasantest resolution I could have arrived at; and very soon I was poring over the construction and composition of such an epistle as would elicit a kind and speedy answer from Aunt Dorothy, and relieve me from further care as to my embarrassments. I took great pains over it, being anxious not to alarm or offend the old lady; but at last, after spoiling about a quire of note-paper, it was finished to my entire satisfaction, and I went out myself and posted it. The moment it slid out of my grasp into the depths below, doubts rose up of my prudence in having applied to her. What would she say? Perhaps disinherit me altogether. Well, it was done, and I could only hope for the best. I half hoped for an answer that same evening, as Aunt Dorothy was usually very prompt; but none came; nor was I even the next morning cheered by seeing her well-known diminutive handwriting on the breakfast-table. It was strange. The day wore on; the next one dawned, and still there came no answer. I even strolled down in the evening past her house, with the half-formed idea that she might have gone away for a day or two; but there she was; I could see right into the dimly-lit dining-room as I passed, and there, with Miss Turnour by her side, was Aunt Dorothy.

She was evidently offended. The breach must not be widened by another attack. This tacit ignoring must be regarded as a refusal. And when day after day passed bringing still no reply, I at last confided my anxieties to an old ally of mine, Tom Rutheven, who decided that the old lady had not liked it, and generously offered me himself the desired loan, which I gratefully accepted, and may here add, faithfully repaid. So I no longer wanted the money; and as it would have been absurd to stand on my dignity with my aunt, I resolved to go to see her, and unless she herself alluded to it, to make no comment myself either upon my application or upon her silence regarding it.

I went in with some trepidation; but Aunt Dorothy had evidently got over my offence if she had been offended, for she seemed rather more

glad to see me than usual, though not a syllable escaped her lips about the letter. She and Miss Turnour were busily engaged in looking over some tradesmen's books when I appeared; and during my visit she informed me that several of them had sent in their accounts twice. As these accounts were supposed to have been settled weekly, she could not understand it: the amounts were considerable, and to pay them over again, as she seemed inclined to do, was perfectly absurd.

'Let me manage it,' I said. 'Shew me the books.'

'The books don't matter,' she answered; 'Mabel has paid them regularly, and naturally never thought of looking to see that they were receipted.'

'Did you pay them by cheque?' I asked next; 'for in that case it will be easy to prove it.'

'I paid them in money,' responded Miss Turnour, to whom my question had not been addressed.

'It is very strange,' I replied; 'such respectable shopkeepers as those could scarcely all combine to cheat you, aunt. I had better go and see after it, or get your solicitor to settle it.'

'Yes; do get your solicitor, Miss Vyvian—pray take Mr Geoffrey's advice.'

I was always called Mr Geoffrey at my aunt's, although my surname was like her own, Vyvian.

'I'm sure I'm very sorry to be reflected upon,' continued Miss Turnour, 'very, very sorry; and of course it's my fault.'

'If I don't blame you, who has a right to make reflections?' rejoined Aunt Dorothy, flashing an angry glance at me from under her gold spectacles. She was thinking of the letter now, I thought. 'Shut up the books, Mabel, and we can settle about them when Mr Geoffrey is gone.'

Miss Turnour gathered up quite a small pile of red glazed books, and tossed them in what I knew was meant to be a sort of slap at me on to the side-table, whilst she dashed, or pretended to dash away a tear, which my proposition, I concluded, was supposed to have elicited.

Aunt Dorothy waxed indignant against me, and ignoring my presence, sought to comfort and console her now violently indignant attendant, who sobbed abundantly, and wiped away, as far as I could see, not a single tear. The more she wept, the stronger grew my suspicion. Before I left the house I had come to the conclusion not only that she had robbed my aunt, but what perhaps to be quite honest—touched me still more sharply, that she had suppressed or stolen my letter. I was convinced of it, and it would have taken a good deal to disabuse me of my belief. At present it would be useless to speak, but for the future I resolved quietly and steadily to watch Miss Turnour.

As time went on I gathered from my aunt that she had paid the bills over again. She admitted having done so with great unwillingness; and I received but small encouragement from her to inquire further into what she deemed was no earthly business of mine.

Two or three months after this, my aunt's and Miss Turnour's happy intercourse was interrupted by the arrival from India of a cousin of mine, consequently a niece of Aunt Dorothy's, a pretty girl of about fifteen. Ella Aubrey was not to be compared to Miss Turnour in point of regular beauty;

but how infinitely sweet and charming I thought her when we first met; what an innocent unsophisticated child she was, and how grieved and distressed I was to see the intimacy which was at once struck up between her and Mabel Turnour. They were never apart; but as my aunt fostered and encouraged the friendship between them to the last degree, I of course could only look on and regret what I saw no means of remedying.

Ella was not very cordial to me at first—a fact which I justly attributed to Miss Turnour's influence. However, her repulses were not very severe, and I trusted in due time we might become better friends. She had come from India accompanied by a servant, by name Marian Holdern; and before they had been a week with my aunt, a line-and-cry got up that a magnificent black lace shawl was missing; and suspicion fell upon Marian. She, and no other, my aunt affirmed, was the thief.

Again I entreated that an investigation might be made; but this Aunt Dorothy peremptorily refused to listen to. Marian, weeping and protesting her innocence, was discharged; but as almost simultaneously with her departure, several other articles of value were missed, there seemed little doubt of her guilt, though my aunt still strenuously refused to put the matter into the hands of the police. Nothing I could say would induce her to do so; and as she was the sole sufferer, no one could complain; so Marian was summarily dismissed, and the black lace shawl and other valuable items were lost to Aunt Dorothy for ever. Shortly afterwards, the latter, accompanied by Ella and Miss Turnour, went down to Brighton for a little sea-air. They had been away about a fortnight when I was startled by receiving a telegram desiring me to come down at once. Something had happened; what, I was left to imagine, as I whirled rapidly down by the mid-day express. I read and re-read the telegram; but no surmises of mine had faintly come up to the real state of the case, for on my arrival, though I had guessed it must be a bad business to cause my hasty summons, I was horrified to find not only Miss Mabel Turnour, but my own little cousin in custody on the charge of theft!

Aunt Dorothy was distracted. Ella wept wildly at the sight of me, and from neither could I elicit anything beyond the most incoherent exclamations with regard to the whole affair. Miss Turnour, however, sat looking supremely cool and indifferent; but it was not from her I cared to derive my information. From other sources I gathered that several thefts had been committed in the lodgings where they were—silver spoons, money, and other valuables had vanished mysteriously; lastly, the landlady's watch had disappeared, and its abstraction had determined her to be trifled with no longer. She said nothing, but quietly summoned the police to her aid, who at once declared a general search must be instituted. The spoons were found in a box belonging to Miss Turnour, the watch in a small bag of Ella Aubrey's. Both protested their innocence—Miss Turnour with the coolest composure and indifference, Ella in abject terror and dismay. However, justice must be done, and the two were committed for trial at the quarter-sessions, my aunt's security being accepted for their appearance. Immediately afterwards the trio under my charge departed for London, there to remain until the trial took place.

I never for one moment suspected Ella of any guilt in the matter; but my convictions of her innocence would little avail her in the face of such circumstantial evidence as would inevitably be brought against her. My duty was plain, and I resolved not to shrink from doing it whether it offended Aunt Dorothy or not, for, strange to say, not even this catastrophe had in the faintest degree altered her towards Miss Turnour; in fact the hold she had upon her affections seemed rather to have increased than diminished.

I kept revolving plans in my head as we whirled towards London, conscious that under her fragile lace veil Miss Turnour, from her corner of the carriage, was eyeing me keenly, as if she would fain have pierced into the recesses of my heart, and found out what I was thinking of. I had hardly shaped my intentions yet, but one thing was quite clear to me—the only means for saving Ella was to convict Mabel Turnour; and to convict her, my first business was to discover her antecedents.

Aunt Dorothy sat in a painfully erect posture all the way up to town, hardly vouchsafing any reply to my well-meant remarks. Neither she nor Miss Turnour was too gracious; but I was sure I was a slight comfort to Ella, who was in a state of almost prostrate grief, feeling her new and dreadful position to the very uttermost. When we arrived at the station, I hurried them into the brougham which was waiting; and Aunt Dorothy then said something very indefinite and indistinct relative to my going to see them that evening: 'If you choose—dinner—seven conversation affairs.'

I just caught the disjointed words, and would fain have declined, had it not been for Ella's large pleading eyes and pale cheeks. They decided me; so it came to pass that I dined with Aunt Dorothy that evening. I had hardly entered the drawing-room before I noticed with astonishment that the Dresden clock, so well remembered in my youthful days, and so prized by Aunt Dorothy, was gone from the bracket on which it had stood for so many years.

'Why, Aunt Dorothy,' I exclaimed, 'what have you done with your clock?'

'My clock!' repeated my aunt, 'my clock! Why, nothing. What do you mean?' She hurriedly adjusted her spectacles, and gazed anxiously towards where it had formerly been.

'Ring the bell, Mabel!' she said almost fiercely; 'ring at once. I would not lose that clock for anything. Who can have dared to touch it?'

'Norris,' she said, addressing herself to the parlour-maid, who appeared directly, 'Norris, what is the meaning of that?' pointing to the vacant bracket.

'I don't know, ma'am,' answered Norris stolidly.

'You don't know! You *must* know! Don't tell any falsehoods, Norris. You know I won't be trifled with.'

'No, ma'am, I don't know, not no more than a infant,' affirmed Norris. 'I do know the clock's gone; but it's been gone since the day you went to Brighton; I noticed it to cook directly you were gone.'

'My Dresden clock! my grandmother's Dresden clock!' gasped my aunt. 'Norris, this won't do; tell the truth.'

'I've told it; I have indeed, ma'am.—Dinner's on the table, ma'am.'

This latter announcement interrupted further investigation; but I could see my aunt was troubled; however, knowing her weakness for Mabel, I resolved to give her no chance of consulting with me, but simply to go direct from her house and secure the services of a clever detective. If he could find the clock, the thief would soon be discovered. I could scarcely contain my impatience to get away, or my disgust at Miss Turnour's almost childish proposition to my aunt for promoting the chance of finding the missing clock; she was so sympathising and so puzzled that it required all my self-control to prevent myself breaking out before her. As far as I could hear, the latter simply intended to put up with her loss. So it behoved me to institute my search very secretly.

The following days were devoted by myself and a very able detective to an investigation of all the likely pawnbrokers' establishments in town, and in dragging to light more Dresden clocks than I had ever before dreamt existed. At last we came upon one which I felt almost certain was the one we wanted; but I had become almost puzzled with the numbers we had seen. However, I remembered the chip off the aster. I looked—there it was. Yet was that sufficient? Scarcely. It convinced me. But it was not enough. However, I recollected that several years before this precious heirloom had been intrusted to a jeweller in Regent Street to be cleaned: he might possibly be able to identify it. Accordingly, off we set; and on my recalling the circumstances to him, he recollected something about a Dresden clock, but so little as to be of no use to us. Just as we were leaving, he volunteered to allow us to look over his book of that particular year; and after much searching, Miss Vyvian's Dresden clock for cleaning was found duly entered, No. 1222.

'What does that mean?' I asked.

'The number of the clock,' he answered.

That was enough. Back we drove to the pawnbroker's to examine the clock there. The number corresponded. No. 1222 was Aunt Dorothy's clock. The description given of the person who had pawned it tallied exactly with Miss Turnour, all but the name, which she had given as Mrs Jones. However, the case was so clear that I had no difficulty in procuring a warrant for her apprehension, and, accompanied by a policeman, I proceeded to my aunt's house. Miss Turnour was sitting on a low stool by the fire, close by my aunt's chair, with the easy familiarity of a spoiled child. Her fair face had a bright flush upon it, which faded slightly when I advanced and sternly charged her with the theft.

Aunt Dorothy shrieked; and Ella, who was sitting looking the picture of misery when I entered, hid her face in her hands. But Mabel Turnour, looking more beautiful than I had ever seen her look, rose up and faced me, only the now deathly pallor of her countenance betraying her inward fears. Outwardly, she was as bold as a lion.

'Don't you see it all, aunt?' I said. 'Don't you see how you have harboured a viper, and how she has injured that poor innocent child there? I have a warrant to arrest her.'

'What have you done?' cried Aunt Dorothy in sudden horror. 'How have you dared to interfere? Meddling officious boy!'

Miss Turnour laughed mockingly; but her hour

had come. Even Aunt Dorothy was obliged to own that for Ella's sake Mabel's boxes must undergo an investigation. And, not to weary by details, I need only say that search resulted in the discovery, amongst many other things of minor consequence, of fifty-six letters addressed to my aunt, which she had opened, and suppressed, nine amongst others—pawn-tickets, empty spirit-bottles, and innumerable other articles. The case seemed clear enough to convict her ten times over; and she was lodged in jail, parting from Aunt Dorothy with much assumed grief; whilst the latter shrank from me with ill-concealed aversion, and was far more filled with indignation than gratitude for my having taken so much trouble to deliver her from such a woman.

I have said she was good-looking; and her beauty was so powerful that when her trial came on, notwithstanding the overwhelming evidence against her, the police magistrate, plainly biased by her fair face, intimated an intention to discharge her, and was with diffidently persuaded to remand her.

Ere her next appearance, viz, by the influence of our solicitor, had induced Aunt Dorothy to obtain discharge of her bail for Mabel on the Brighton charge. Owing to the refusal of the pawnbroker to swear that it was she, and no other, who had pawned the clock, the benefit of the doubt was cordially granted her by the magistrate, and he dismissed the case. But a Sussex constable re-arrested her on the Brighton charge, as she was retiring; and in due course she was tried there, and sentenced to six months' hard labour; the prosecutrix there withdrawing, of her own free will, all charges against Ella. She received her sentence coolly. And when it was over, I heard that a man, who said he was her husband, was waiting to take her away. Some years afterwards, I heard that she and a notorious housebreaker with whom she consorted had been sentenced to penal servitude.

The foregoing narrative, which is founded upon incidents that actually occurred, is another illustration of the evils of indiscriminate acquaintance-ship. In my aunt's case, it turned out that, in answer to her advertisement for a maid, a young woman of prepossessing appearance and manner had applied and had been engaged, without proper investigation as to her character, and, as was afterwards ascertained, solely on the strength of a *forged testimonial*.

TERMITES.

THE wonderful habits and instincts of bees and ants are well known, and have very justly excited universal admiration and astonishment. The habits of the Termite or white ant are in some respects even more wonderful, though probably not so well known. We venture, therefore, to offer our readers a few particulars concerning these extraordinary insects.

Though called white ants, they belong to an entirely different order of insects from the common ant. As many as twenty-four different species are known to exist, nine of which belong to Africa, nine to America, two to Asia, and two to Europe. Like ants, they live in societies, and are divided into males, females, and neuters. The last, however, consist of two distinct classes or 'castes'—the workers and the soldiers. Apparently they do

not pass through complete metamorphoses, for on issuing from the egg they do not differ in any respect from the adult except in size.

The males and perfect females have four large transparent wings, the second pair being rather smaller than the first. At the beginning of the rainy season they leave the nest in myriads and pair. They then shed their wings and fall to the ground. So eagerly are they sought after by birds and other enemies that very few couples escape being devoured. The survivors are carefully sheltered by the workers, and become the kings and queens of new colonies. They are much larger than the workers and soldiers, and are kept in close confinement, the doors of their cell being too small to permit the egress of either. The queen is always found in a gravid condition, her abdomen enormously distended with eggs. 'This soft, whitish beast,' says M. Michelet, 'a belly rather than a being, is as large at least as one's thumb; a traveller professes to have seen one of the size of a crawfish. The larger she is, the more fruitful, the more inexhaustible, this terrible insect-mother seems to be the more adored by the fanatical rabble. She seems to be their beau-ideal, their poetry, their enthusiasm. If you carry away with any rubbish a portion of their city, you see them instantly set to work at the breach to build an arch which may protect the venerated head of the mother, to reconstruct her royal cell, which will become (if there are sufficient materials) the centre, the base, of the restored city. I am not astonished, though, at the excessive love which this people shew for this instrument of fecundity. If all other species did not combine to destroy them, this truly prodigious mother would make them masters of the world, and—what shall I say!—its only inhabitants. The fish alone would be left, but insects would perish. It suffices to be remembered that the mother-bee does not produce in a year what the female white ant can produce in a day. By her they would be enabled to devour everything; but they are weak and tasty, and so everything devours them.' The number of eggs produced by a single termite is prodigious. She is said to lay them at the rate of one in every second, and as the process of oviposition continues without interruption for many weeks, and even months, the number of eggs produced by one of these insects in a year amounts to many millions.

The workers and soldiers are wingless, and quite distinct from the males and females from the moment they emerge from the egg, and do not therefore acquire their special characteristics in consequence of any particular course of training or food. The workers of *Termes bellicosus*, the largest of the species, are about the size of a large ant, to which they bear some resemblance. Their bodies are very soft, but they are furnished with mandibles which are capable of destroying the hardest substances. Their duties are to build the habitations and to keep them in repair when finished, to attend upon the royal couple, to nurse and rear the young from the egg upwards, and to lay in a plentiful stock of provisions.

The soldiers number only about a hundredth part of the community. They are twice as long, and weigh fifteen times as much as the workers. Their heads are horny and much larger than their bodies; their mandibles are larger than those of the workers, and more adapted for weapons of

warfare than for implements of labour. They are the defenders of the colonies and the maintainers of good order, and most faithfully and energetically do they discharge their duties. Their bite at once draws blood, and so tenacious is their gripe that they will rather die than let go their hold. The negroes, on account of their bare feet and scanty clothing, are forced to beat a hasty retreat if they venture to attack one of the hives. Yet strange to say, these formidable heroes, upon whom the safety of the numerous family so largely depends, are totally blind; and most amusing it is to see them, when attacked, moving their monstrous heads from side to side, opening and shutting their jaws.

Their habitations are constructed with wondrous skill. These 'termitaria,' as they are called by naturalists, are conical mounds surrounded by cones decreasing in size as they recede from the central mass, and are formed of earth worked into a hard compact mass. They are strong enough to bear the weight of a man. Indeed, M. Fiquier relates that buffaloes mount upon them and use them as watch-towers from which they can see if the lion or the panther is threatening them. These mounds attain a height of from ten to twelve feet, and one traveller gives twenty feet. The walls of these gigantic structures are from fifteen to twenty feet thick. The entrance is at a considerable distance from the mound, and is connected with the interior of the abode by underground passages. Each 'termitarium' consists of a vast number of cells and connecting galleries formed of clay or particles of vegetable matter glued together with the saliva of the workers. On a level with the ground and in the centre is the palace of the royal couple; the chambers encircling the royal apartment are inhabited by the workers and the soldiers; while the outer cells serve as storehouses, which always contain an abundant supply of provisions. The egg-cells or nurseries are supported upon pillars, which rest upon the royal cell. Above the nurseries there is a large hollow space about one-third as large as the whole middle cone, which not only serves to ventilate the nurseries but also lowers the temperature of the whole of the interior. The corridors which maintain communication from one cell to another are at a depth of three or four feet from the surface. These are intersected by smaller passages, some of which are spiral. A termitarium is not always the exclusive work of one species, but may have been built by several working in conjunction. When this is the case, it is observed that each species has a distinct mode of compacting the materials, and confines its labour to a particular spot.

A traveller relates that, being anxious to see these curious little creatures build, he made a breach in a nest with his hatchet. A soldier instantly appeared, who was speedily followed by two or three more, and in a very short time a whole army was collected. Owing to their blindness some confusion ensued, and it was an amusing sight to see them tumbling over one another and rolling down the sides of the hillock biting everything that came in their way. They soon recovered themselves, however, and the bustle subsided. As the traveller made no further breach, the soldiers at length retired. Thereupon our rushed the little labourers in crowds, each carrying a load of tempered mortar, and depositing it on the edge of the

hole, they hurried back for more. So numerous were these tiny builders and so rapidly did they work, that in half an hour the breach was repaired. Such is the number, size, and regularity of these edifices in some regions, that they have been compared to a collection of negro huts.

The species named *Termes mordan* and *Termes atron* build regular columns, surmounted with projecting cone-shaped capitals. These curious dwellings are about twenty inches in height. They are constructed of black clay, and have the appearance of huge mushrooms. A few termites build their nests around the branch of a tree. They are as large as a sugar-barrel; and though only composed of small pieces of wood stuck together, they are able to withstand the storms of the tropics.

The habits of the marching termites are also very interesting. The English traveller Smeathman, who studied these insects with great care when in South Africa, one day saw an army of them march past him. His attention was first attracted by a loud hiss. This noise caused him to move a few paces from the path, when he saw an army of termites coming out of a hole in the ground. They came out in vast hordes and with great rapidity. At a short distance from the hole they separated into two columns, composed almost entirely of labourers, 'twelve or fifteen abreast, crowded as closely as sheep in a drove,' with here and there a soldier. While these were hastening forward, a great many soldiers appeared, scattered along both sides of the two companies, some standing still, others marching up and down the lines, but all evidently prepared for any attack that might be made upon the labourers. 'But the most extraordinary part of the march was the conduct of some of the soldiers, who, having mounted the plants which grew here and there, had placed themselves on the points of the leaves, which were raised ten or fifteen feet from the ground, and overlooked the army marching below. Every now and then one or other of these would beat with his forceps upon the leaf, making a noise similar to that made among the warrior species. The signal produced the same effect upon the marching white ants, for instantaneously the whole army returned the noise, and obeyed by increasing their pace with the utmost haste.' He saw the two columns at length unite and descend into the earth by two or three other holes. They continued marching past him for more than an hour without any apparent diminution of their number.

The accounts of the destruction caused by the termites would be incredible, were they not too well attested to be doubted. They will eat into the hardest substances, particularly wood, which seems to be a favourite article of diet with them. Stanley, the discoverer of Livingstone, relates that on one occasion upon examining certain stores he found that these insects had not only devoured the box in which the guns were packed, but had even eaten the gun-stocks. In dwelling-houses the utmost care has to be taken to guard against their depredations. Bed-posts and the legs of tables and chairs are placed in vessels containing water. Nothing to which they can gain access escapes their voracity. Boots, shoes, and the contents of trunks, if left upon the ground, are destroyed in a single night. They rarely venture in sight, and so secretly are their operations performed, that

the utmost precautions of the inmates are often rendered abortive. Having extended their galleries beneath the house, they will perforate the floors, hollow out the beams and rafters, and if not speedily destroyed, will render the house unsafe for habitation. They always leave a thin shell of the object attacked, so that detection is impossible; and curious stories are told of the manner in which articles of furniture, &c. which have been operated upon by these invisible destroyers have fallen to pieces on the slightest touch, much to the chagrin and often astonishment of the beholder.

At La Rochelle, Rochefort, and other towns in the south of France (into which country they are supposed to have been unintentionally imported with some bales of goods at the end of the last century), many houses have been completely undermined by them. At Tournay, Charente, the floor of a dining-room gave way during a dinner-party, and the occupants were precipitated into the cellar. At La Rochelle the termites took up their abode in the prefect's house. One day a clerk on opening the box in which the government documents had been deposited found them, as he thought, complete and uninjured; but on raising the topmost leaf, he saw only a small heap of rubbish. The termites had bored through the wood and the cardboard, and had eaten the parchments, having taken their usual precaution of leaving no trace of their handiwork on the exterior.

These destructive insects are not without their use in the economy of nature; not only do they act as scavengers, by devouring animal and vegetable refuse, but they serve as food to the natives. Some idea of the esteem with which this article of diet is regarded by the latter may be formed from an expression made to Dr Livingstone by one of their chiefs. One day, as they were discussing the merits of certain delicacies, the chief asked the doctor if he had ever tasted white ants. Livingstone replied that he had not. 'Well, if you had,' said the other, 'you never could have desired to eat anything better!'

UMBRELLA GOSSIP.

UMBRELLAS were used in Paris before London. They were first carried in the metropolis by one Jonas Hanway, who underwent a species of martyrdom from public ridicule while indulging in this luxury. Even ladies did not take kindly to the umbrella until Queen Anne's reign, when we find Swift make mention of them. Cowper in *The Task* also alludes to these useful articles which were first kept at coffee-houses, and borrowed by the frequenters. They were then very cumbersome, and were fitted with a ring at the top, wherewith to carry and hang them up, while instead of handles, the sticks were furnished with knobs to rest on the ground, as parasols are now. The materials used in their construction were leather, feathers, and afterwards oiled silk; but the last sometimes stuck, and could not easily be folded. In our young days, sixty years since, umbrellas were of blue or green cotton—heavy and clumsy to an odious degree. At length the fashion improved. As the usefulness of umbrellas

became more apparent, lighter frames and better covering material gradually came into vogue, until the present slinness of perfection was attained. Various additions to umbrellas have been suggested by people, as, for example, the fitting of small glass windows in them, through which to look out ahead when beating against the slanting rain; a theory that would break down in two senses, if reduced to practice. An American lady lately devised some ingenious system of cords attaching the umbrella to the dress, which would counteract the effects of the wind, so undecided seems Boreas in his movements the moment we hoist one. Though in one sense a cumbersome companion, the umbrella is not devoid of usefulness, whether we consider it as a walking-stick, the means of hailing a 'bus or turning aside the charge of a mad bull, or of getting introduced to a lady, unprovided with one on a wet day.

On the other hand, as some drawbacks are inseparable from most blessings, umbrellas are on many occasions a decided nuisance. Picture-galleries and other places only too practically remind us that umbrellas, like dogs, are not everywhere admitted; while cloak-rooms at concerts and theatres have a way of sadly confusing owners with this kind of property. It is this that produces such exquisitely satirical advertisements as the following: 'If the gentleman who took the silk umbrella from Halle's concert last night by mistake, and left the gingham in its place, will return the same to the undersigned's address, he will oblige.' Many people above any suspicions of kleptomania have a pleasant knack of absently taking the best umbrella from their friends' hall-stands; a remark which, by the by, is not inapplicable to hats. Robinson Crusoe was, we verily believe, the only individual of our acquaintance who could deposit his huge 'Gamp' in his vestibule with the happy assurance that he would not find an inferior one in its place on the morrow.

Are there any, we wonder, who, laying their hands on their hearts, can conscientiously declare that they never forgot their umbrella in a shop, 'bus, train, theatre, church, or private house? We have heard friends, finding their searches after this kind of lost luggage getting monotonous, vow in exasperation that their umbrellas ought to be hung round their necks. Another evil is the liability of umbrellas to suddenly collapse when you are rounding a corner, for they are worse than useless when rain brings its brother element, the wind, to its assistance. A mere allusion to the drippings of umbrellas down one's neck, when on the knifeboard of a crowded omnibus, is enough to call up pathetic reminiscences in the mind of every citizen. But the situation most to be pitied was that of an Irish umbrella-mender whom the writer once noticed on the deck of a ferry steamer. It was raining torrents, and there he stood unsheltered in the midst of it all, with the shattered wrecks of about a dozen umbrellas under his arm. 'Sure it's mighty hard anyway,' he at last soliloquised, 'me gittin' wet like this, and all thim umbrellas wid me, but not wan's any use at all.'

The observant declare there is as much indication of a man's character in the style of umbrella he carries, as in any other portion of his belongings. They say a Manchester man is *always* known by his umbrella, and indeed, poor fellow, few (excepting perhaps the Glasgow man) need one more than he does. An able writer in the *New Quarterly*, describing his hero's introduction into an elitist's waiting-room where others were assembled, makes the following remarks concerning umbrellas, which in some measure bear out the foregoing observations: 'Edward Wynter took a chair and sat down. Every one in the room had a bundle of papers or a note-book in his hand, and every one of them leaned on a stout umbrella. Three of the party were men, two ladies. A tall man with a red face, a very stout man with a red face, a third man of a shadowy presence, who kept in the darkest corner of the room, and planting his umbrella between his knees, as all the others did, seemed to be lost in contemplation of its knob. Edward Wynter saw that he ought to have brought an umbrella; he had come among them as a man unarmed.'

King Koffee's umbrella, brought home by General Wolesey, 'which was the cause of so much merriment amongst your special correspondents, was in the eyes of the Ashantees by no means the least amongst their losses. It was called in their language "Bo Haman"—the destroyer of nations—and represented to them a greater loss than would have been that of its Queen's colours to a British army.' We find elsewhere the subjoined details of this wonderful structure: 'The stick, which is of ornamented plain wood, measures eleven feet from top to bottom. When open, the diameter is seven feet some inches, and the length of the covering when shut more than six feet. The material is velvet, partly crimson and partly black, in different-sized squares with gold trimmings. Four lions' claws, roughly carved and gilt, are symmetrically placed, and some square pieces of various objects are distributed all round as fetiches or charms. They consist of the skin of animals and serpents, and one small piece of scarlet woollen material with a white border. These are supposed to be sacred emblems, and to have received some peculiar endowment from the priests.' King Koffee's umbrella is now one of the objects of curiosity in the Museum of Science and Art at Edinburgh.

It is surprising what an amount of amusement the umbrella, regarded from a comic point of view, has afforded the public. Where would the firm of 'Gamp,' 'Brown,' 'Sloper,' and Company be without their stock-in-trade of gingham and whale-bone? The low-comedy man of the theatre might just as well forget his part on the stage as his lumbering umbrella. What, for instance, would Paul Pry be without *his*? What effective scenes, too, are introduced into burlesque through the medium of variously coloured umbrellas; and what an exponent of ridicule they become in the hands of the comic artists! If this article is particularly cumbersome about the handle, has clumsy whale-bone ribs starting through its skin, no ferule, and a piece of rope dividing its ruins with a kind of waist in the middle, then is the negro stump orator furnished with the emblem of eloquence, and the souls of his audience happy in consequence. On more than one occasion our subject came in for its share of Dickens's humour, and Mrs Gamp will be

chiefly immortalised through her celebrated representative of the umbrella order; her name being just as popular a term for umbrellas, as Dolly Varden's was for hats and dresses. In the description of Mrs Gamp's apartment it is thus alluded to: 'Lastly, Mrs Gamp's umbrella, which, as something of great price and rarity, was displayed with particular ostentation.' In *Black House*, Mrs Bagnet's umbrella, which had been her faithful companion in all parts of the world, is thus pictured to us: 'It is of no colour known in this life, and has a corrugated wooden crook for a handle, with a metallic ornament let into its beak or prow; which ornamental object has not that tenacious capacity of sticking to its post that might be desired in an article long associated with the British army. The old girl's umbrella is of a flabby habit of waist, and seems to be in need of stays. She never puts it up, but uses it to point out joints of meat, or to arrest the attention of tradesmen by a friendly poke.'

If any one wishes to study human nature in the bud as it were, let that person lend an umbrella—an old one will do—to a child, and see the airs of importance the small individual at once assumes, concentrating for the time all the purposes of its existence to the display of that article. Indeed we are persuaded that as much profitable instruction could be derived from moralising on an umbrella, as was afforded by Dean Swift's *Meditations on a Broastick*. In short, without umbrellas of one sort or other, what should we do? As things stand, the umbrella is our walking companion, our friend, but scarcely our protector against persistent rain. The man has yet to arise who can clothe his fellow-creatures with apparel neat in appearance, moderate in price, and comfortably waterproof.

SONNET TO A PAIR OF OLD BOOTS.

[Written, seventy years ago, by a gentleman now deceased, and found among his papers.]

Ye two companions of my wintry way,
Oft have we trudged it many a tedious mile
Through slop, and mire, and mud, and clinging clay,
And paced along with true pedestrian toil.

Now sore against my will we part a length,
For ye are both grown old and both worn out;
Your tough tanned bodies have resigned their strength,
And waters pierce your soles that once were stout.

What boots it now that you were boots of yore
So neatly shining, supple, smooth, and black;
No patent lustre can your gloss restore,
No cobbler can recall your value back.

So man shall fail, and all his works to boot,
Nor art nor medicine decrepitude recruit.

CLOSE OF THE LAMBERT FUND.

We have to intimate that the fund raised for the benefit of James Lambert is now closed; a sufficient sum having been collected for the purpose in view.

ART AMONG THE COAL-SCUTTLES.

FOR some years there has been a considerable and pretentiously authoritative chatter about art and high-art. The object has been praiseworthy, being nothing less than to effect a tasteful improvement in the decoration of dwellings, and in the shape, colour, and general character of articles in daily use. To effect this comprehensive object, great and costly exertions have been made. The Museum at South Kensington and various subordinate Museums have become dépôts of articles, shewing how a vast number of things may be improved in point of artistic taste. The advantages to be derived from these exhibitions we willingly admit; yet it occurs to us that this incessant clamour about art is susceptible of being carried too far, and rendered positively ridiculous.

Let us explain our meaning. Elegance in form, and a harmonious adjustment of colour, are all very well in their way; but there are other matters to be thought of. For example, we have to consider cheapness in adaptation to the means of a vast population, not overburdened with money, and who in their purchases can scarcely exercise a choice. We have, as regards innumerable articles, to consider the qualities of convenience and durability. It is of no use to say: 'Look; there is a water-jar of a classic Greek pattern, the perfection of art.' True; but we do not want water-jars such as Greek girls gracefully bore on their head from wells, two or three thousand years ago. We draw water in jugs from pipes and cisterns, and women do not now think of balancing water-jars on the top of their head. The idea is utterly exploded. Then, as concerns drinking-glasses, it is absurd to speak of ancient Venetian patterns as being the right thing. People will not have them. They wish good clear crystal of fairish shapes, which being set down on a table will not topple over by a touch, and probably be smashed to bits. It is in vain to represent that your plain well-shaped tumblers, with a substantial foundation to keep them on their feet, are not according to the rules of high-art. A housewife

in choosing a parcel of tumblers has primarily to consider what are not only good-looking but what are likely to last.

The lamentations uttered over the dreadful degeneracy of the age in not buying genuine Turkey carpets, with their delicate colours and patterns thousands of years old, seem likewise to us exquisitely absurd. Take the population of these islands overhead, how many of them, if they had the will, are able to buy Turkey carpets? The bulk of people are glad to get carpets of any kind. A 'Kidderminster,' if nothing better can be reached, and a 'Brussels,' of good fabric and modest device, are nearly all that can be aimed at. According to the obligations imposed by high-art, it may be very wrong to buy Kidderminster and Brussels carpets, or imitation Turkeys; but learned lecturers who lay down the law on the subject, should, we humbly suggest, begin by telling us how people are to get the money to buy the genuine article. We have not the slightest objection to see every room in the humblest dwellings decorated with carpets from Smyrna in the approved antique style. Our only difficulty is, to know where the money is to be procured to purchase these wonderful specimens of high-art.

We have been led into these remarks by one of the most amusing lectures on the subject of art that ever fell under our notice. It was delivered a short time ago at Oxford, by Mr Mark Pattison, Rector of Lincoln, in distributing prizes in connection with the schools of Science and Art at South Kensington. The text of the address will be found in *The Times*, November 18. In this extraordinary harangue, Mr Pattison takes the public severely through hands for being so indifferent to the claims of art in their purchase of drinking-glasses, carpets, and other household articles. Some of the present backward state of art and want of taste in purchasers, as far as we can gather from his observations, is due to the practice of mechanical multiplication. Mr Pattison's words are: 'By the habit of mechanical multiplication invention is killed, and the soul degraded.' This is strong language, and not very complimentary

to that great manufacturing system which has contributed so materially to the wealth and happiness, we might almost say to the very existence of England. On a point of so much delicacy, the erudite lecturer should have uttered no uncertain sound, and we respectfully intimate the hope that he will give some reconsideration to the subject.

Finding fault with many things as below the exalted demands of high-art, Mr Pattison is specially eloquent in pointing out certain artistic deficiencies in coal-scuttles. The charges on this account somewhat surprised us, for we had always admired the good taste demonstrated by the English in their burnished copper coal-scuttles, or at anyrate, scuttles japanned and fancifully decorated, standing conveniently and demurely by the fireside. It will be fair to let Mr Pattison tell his mind as regards the shortcomings of art in relation to the coal-scuttle question.

'Thirty years ago you saw in the drawing-room a coal-scuttle of bright copper or brass. It was a semicircular box, with a wide open mouth. It had a swing-handle, by which it was exactly balanced, and it rested on a truncated cylinder, all of the same material. It was tolerably, although perhaps never perfectly adapted to its purpose—that of containing a temporary store of fuel—which is, unfortunately, dirty in its nature. It was not a work of art, but being without ornamentation, it did not offend by pretending to be one. It had two defects—one of shape. Though well adapted for containing small Newcastle coal, as used in London, it was not equally well calculated for holding the large lumps of fuel-coal supplied to the southern counties from the fields of Leicestershire, Warwick, or Wales.' Here, we beg to say, the lecturer is wrong. We have for more than forty years used a burnished copper scuttle for tolerably large lumps of coal requiring to be lifted by a pair of tongs; and no inconvenience has been experienced. 'Its other fault was that of material. The copper or brass scuttle offended, if not kept spotlessly bright. This was trouble, and trouble is compounded of energy and time; energy and time are costly.' Here, there is another blunder. Nobody complains of the trouble in keeping the copper scuttle well burnished. The only fault found with it is its cost. 'It became desirable, therefore, to find an economical substitute for the copper scuttle, which was too costly, not in its original acquisition, but in its maintenance. As to the material of the substitute, of course there would be no doubt. It must be sheet-iron. Wood has been tried; but any wood that is strong enough adds too much to the weight of the coal, which is already great. We are compelled to fall back upon sheet-iron as the only available material of our box. As we thus lose the polished sheen and bright effect of the copper or brass metal, it becomes an object to compensate the drawing-room for that loss by endowing the sheet-iron box with some quality, which, if not beautiful shall be agreeable. First, the box is lacquered or

japanned—a process by which a lasting shining surface is engrossed upon the object, but at the cost of disguising the material of which it is made. Certainly this disguise, in the case of an established practice, such as japanning, does not amount to that capital offence in art—namely, the attempt to pass off an inferior substance for a substance better than itself. Silver-plated goods are an attempt to make base metal not pass for, but look like silver. No one is deceived, or intended to be deceived, when an iron plate is coated with seedlac and oil. But observe what, in an art-point of view, this garnishing of the coal-scuttle is. It is an artistic process. It has no economical purpose. The scuttle would answer the purpose it does answer if, like the housemaid's coal-box, the iron sheet was left in its first state. It is said that the oil and varnish preserve the metal plate. I am told this is doubtful. It will hardly be denied that the chief object aimed at in japanning the surface is to obtain the pleasing effects of lustre, gloss, and polish—that is, it is an attempt to confer art-value upon a vessel of common use. Nor can it be denied that the attempt, though very humble, is successful. A mean-looking material is ennobled by receiving a false surface. The iron box has entered the sphere of art. But it is still felt that, as an object in a room in which beauty is studied, our iron box even when japanned is somewhat of an eyesore. It has been attempted to exalt it still further, and to make it rank among the elegant constituents of the apartment. This can only be done in one of two ways—either by form or by ornament. Many have been the attempts to give grace of shape to the coal-box. None of them, I presume, have been very successful attempts at a solution of the problem of combining beauty of form with adaptation to purpose. Of the other attempts to elevate the coal-box by added decoration it is better to be silent. The monstrous vulgarities of the lacquered lids of coal-boxes which stare at us in the windows of the ironmongers' shops are alone sufficient to bear me out in the proposition with which I began, that things are worse at Birmingham, instead of better, since schools of design were multiplied throughout the country.'

There goes a smart indictment against Birmingham for not studying high-art in the manufacture of japanned and ornamented coal-scuttles, and the sad consideration is that things have grown worse instead of better in the coal-scuttle line since schools of design were multiplied! If such be the case, the schools of design are useless, and should be forthwith shut up. Mr Pattison, however, may not be a first-rate authority, and it would be interesting to know what Birmingham has to say on the subject. Does it plead guilty or not in its disregard for high-art in the making of coal-scuttles? No answer. It doubtless laughs at the whole affair as an offensive interference with the calling of large bodies of respectable tradesmen.

We fear that addresses of the kind, to which, not without regret, we have ventured to call

attention, will do little to serve the interests of art; but that, as indiscreetly provocative of ridicule, they may do very much the reverse.

W. G.

THE ARAB WIFE.

A TALE OF THE POLYNESIAN SEAS.

CHAPTER XI.—MATRIMONY.

I MUST say that the Arabs are very easy and agreeable in their ideas of marriage. I dreaded some absurd and fantastic rites; and I found the whole ceremony consisted of exchanging rings and being blessed by the 'teacher!' I was not compelled to be present at the grand festival made by Nizam in honour of the happy event; but I was very glad to go, not only because my friends would feel hurt, but also because Mohammedan etiquette forbids the bride and bridegroom to meet until the evening.

I went round among the pirates, making myself as popular as I could, until the termination of the long day, when I paced up the hill with the dignity of an Arab, and went as slowly as I could to the quarters which had been prepared for me in my absence, and which composed my zenana. I need not say how dearly I was welcomed by the fond heart that awaited me, nor describe the happiness I found in the unrestrained society of Fatima. Suffice it to say that never was man so blessed in a beautiful and loving spouse.

But even though the days passed in a dream of happiness, there was one element of bitterness in my cup. I had renounced my religion, and day by day the thought gave me greater affliction. My conscience, drugged by selfish love, awoke, and tormented me ceaselessly, and Fatima watched my moods with a devotion which I neither deserved nor could comprehend. One day, when I entered her apartment, I sunk into a fit of musing reverie. My darling nestled silently by my side, nor offered to interrupt my thoughts. I mechanically caressed her flowing hair; and her little white hand, with the nails tipped with pink henna, was raised to my forehead.

'Carlos, let me smooth out these wrinkles.'

I sighed. 'Ah, love, suppose they are in my heart, and these on my forehead only the reflections.'

'Carlos, why should they be in your heart, or in mine rather, for your heart is mine; is it not, my lord?'

'You know it is, Fatima.'

'I am happy with you, Carlos; are you not happy with poor Fatima?'

'Indeed, indeed I am most happy, nor do I deserve such love as yours; but Fatima, there is something more than the happiness you can give. I want the peace of my own conscience; I want that which I alone can give to myself—the consciousness of doing my duty, of doing what is right. O Fatima, my wife, my angel, rescue me—save me from this anguish, or I am lost without redemption!'

'Be calm, my lord, be calm, for there is nothing that you can ask of Fatima that Fatima will not give. Are you sorry that you have become an Arab?'

'Yes, indeed I am. Stay, Fatima; do not weep. I am not sorry that I am your husband; but oh,

darling wife, this is not life, this is not liberty. This preying upon the weak and the defenceless, this hunting of Malay wolves with Papuan dogs, this heaping up of treasures never to be used—are these occupations worthy of me?'

'What would my husband do?'

'Let us flee together, Fatima; let us go to my own land.'

'And my father?—'

'I too have a father, who shall be yours—who will cherish you as I do, who will love you as I do, and who will pour blessings daily on your head for restoring to him his son—his only child.'

Fatima, with eyes brimming with soft tears, pressed her red lips to mine, and smiled. 'Am I not yours, my husband? I am the barque, you the wind. Go wherever you list, and I will follow you. I am part of you, as much as my arm is part of me. If my husband goes to Tophet, I will accompany him, for his love and his society are worth soul, body, everything to me.'

Here the impassioned girl lavished upon me a thousand caresses, and in broken accents and with faltering breath poured such a tale of love in my delighted ears as completely ravished my senses. Taught from her earliest years that her sole end and aim in life is to be loved and love, the whole force of Fatima's character was centred on her love for her husband, and she fairly worshipped him.

Feeling that I could completely rely on my wife's assistance and co-operation, I unfolded to her my purpose, which was either to seize a proa or the pirogue, and make my way to Australia, where I could get tidings of my father. To this she assented cheerfully, although she would be cast for ever into another world, and have to painfully commence a new existence. But of this she recked little. Her happiness was to see me happy, and to be with me; and she was resolved upon the sacrifice.

Accordingly, I visited the pirogue during the next day, giving out that Abou and I would go shortly on a cruise. All my possessions were on board, and the writing-desk of the Dutch captain, which contained the bank-notes and the papers which I had faithfully studied without any result. My Fatima's maid Yariya was a great strong woman, as black as a coal, and with the muscles of a prize-fighter. Her husband, Bikur my slave, was a Seedi, as I have elsewhere said, and very strong; and had at my directions brought on board and stowed away as much provision as we could secure. It seemed to me that with his assistance and that of my wife and her powerful maid I could navigate the pirogue and arrive in safety at Hobart-Town or Port Philip.

At length came the eventful evening. Nizam had been unusually kind, and had made my wife a present of a necklace of large pearls, which she received with mingled joy and sorrow. Our plan was, that I should make ready the pirogue for starting whenever the women could be got on board; and accordingly I made Bikur scull me on board and return quietly for them. There was no one in the vessel, and with a beating heart I waited for the eventful hour. There were no clocks to chime, and the chronometer I had taken from the *Moutmein* was the only timepiece for a thousand miles; but the position of the stars indicates the hour with sufficient exactitude.

After weary watching, Bikur slowly paddled a sampan up to the pirogue, with my wife and her maid Yarifa. They had eluded the watchfulness of the sentinels and stolen past. It was then about eight o'clock, and we could count upon eight hours' start; so imploring the blessing of Heaven upon my enterprise, I slipped our moorings, and motioning Bikur to assist me to make fast the sampan, we hoisted first one lug, then the other, and then the jibs and foresail. We made very little noise, and attracted no attention on board *The Shark*, whose two big lanterns were burning; but I knew that the watch would be fast asleep.

We glided on past the huge hulk, our sails flapping as they were momentarily vindled by the mass. I held my breath, expecting every moment to hear a challenge, but none came, and the pirogue rapidly increasing in speed, soon passed into shadow.

I endeavoured to persuade Fatima to go below, but she crouched beside me as I steered, and shook her head. Bikur and Yarifa were more amenable to authority, and went below at once. Soon my ears convinced me that they were sleeping the sleep of the just. We entered the channel, and here the peculiar construction of the pirogue stood us in good stead. There could be but little wind in that landlocked place, but the little there was brought us on gallantly at a pace that the big *Shark* could not have rivalled. Still I confess I was not free from anxiety until I got out of the channel and was steering boldly to the south.

Then I lashed the wheel, the wind being on the starboard quarter, sent my wife down for Bikur, who came up rubbing his eyes, and told him to stand by the wheel, and if the wind rose or he saw a ship, to call me.

With this order I went below to the cabin and gave Fatima her first lesson how to sleep in a square hammock. In sober truth she shewed much more timidity over this tremendous effort than she had done in risking her life by escaping from her father.

It had been nearly dawn when I retired. When I rose it was full noon, and there was not a speck in sight. Bikur seemed quite proud of his steering, which he believed was done by merely holding the spokes. Yarifa got breakfast pretty tolerably, considering the novelty of her situation, and we enjoyed it heartily.

After the meal, I insisted on giving them both a good drilling in handling the sails, slacking sheets, &c., and at last made them both comprehend the names. Fatima too would be taught, so that she might take command while I steered; but I shewed her how to steer in preference, as that required skill rather than strength.

Our compass was rather a splendid affair, one of Nizam's gifts; and Fatima, who was very shrewd, learned to box it with remarkable quickness. She was not long in acquiring the science of steering, which in those calm latitudes, where ships often sail for weeks and weeks at a time without shifting a sail, was not hard or dangerous.

We soon arranged our labours. Yarifa was to cook and to assist in lowering or raising the sails. Bikur had to take turn about in steering with me.

'What am I to do?' cried Fatima.

'Well,' said I, 'you can assist in steering occasionally, when I am tired.'

'No,' said she; 'I'll sit beside you, and work steadily at opening the casket.'

'The casket?'

'Ah!' cried Fatima, 'miserable woman that I am! I kept a secret from my lord. What will my lord give to know it?' With an arch look, the dear creature vanished below, and soon reappeared, bringing the identical casket that we had found in the Dutchman's safe, and the list of words I had given Nizam. 'See here,' said she; 'I have done all these, and there remain to be tried one, two, three—oh, ever so many.'

'Don't do it,' I replied. 'It will be pure waste of time. The secret cannot be found. But we can break it open at the back with a chisel and hammer, as I told your father often. How did you come by it?'

'It was always in my charge, Carlo, from the first, because I knew Feringhi letters. I learned them from mother's nurse, who died four years after mother.'

'And you never said a word; little hypocrite!'

'No, my lord, for it was my father's secret, not Fatima's.'

'But you took it from him.'

'It was to be Fatima's dowry.'

Now that the casket was mine, I must confess I thought more about opening it than I had before. But I had learned by this time that my wife's wits were keener than mine, and I shewed her how foolish it was to look for the secret word in the ship's papers. She saw this too; and made me recite all the particulars of the pillaging, cautioning me not to omit the smallest details.

This I did, and she listened attentively. Then she said: 'This requires consideration, and I will think about it. Do not let us talk of it, my husband; but tell me how I shall live, and what I shall wear in the new world.'

I willingly consented; and recited what I knew of European life, to the best of my ability, replying to her eager questioning rather poorly, I am afraid. Her big black eyes were fixed eagerly upon me; and she seemed to read my countenance, and to know my answers before I had given them.

By this time she spoke English fairly, and I laboured diligently to perfect her, as I was excessively proud of her, and longed in my foolish adoration to see her a queen of English society.

Every day went by like its predecessor, hardly a sail being changed, and the pirogue sped silently over the waters like an enchanted bird. The wind being on the quarter, served either way; so, after sailing seven days due south, I shifted her course about five points to the westward; and I did this because I was not sure of the allegiance of my crew. If I had been, I would have sailed straight as an arrow for Hobart-Town, but in the way things were, I was afraid to face a storm. So I resolved to make the north-west coast of Australia, and to follow the shore-line, sheltering behind bluffs from bad weather.

Day by day the sun rose and set, and we saw no sail. How could we? We were in a part of the ocean unfrequented by commerce, quite out of the great highways; and to see a ship would have been to see an unfortunate driven there by a storm, or a pirate cruising among the islands, and striking down for New Zealand. Occasionally there are roving merchantmen who sail independently in

these waters, but such cases are few and far between.

Bikur had too great a knowledge of the distance in rank between himself and the chief's son-in-law ever to ask where we were going, or when we should return. But Yariifa took the privilege of a cook to demand one fine morning, after we had left Gezireh some seventeen days, what we were doing.

Fatima told her, with an air of great secrecy, that her husband was possessed of magical knowledge, and that her father owned a magic casket which no one could open. He himself could never open it; but that by spells and charms her husband had found that there was a powerful enchanter who dwelt on a great island to the southward, and that he would reveal the charm if seized by four people, two men and two women, two white and two black. This precious farrago of nonsense Fatima gravely confided to the staring Yariifa, who listened open-mouthed.

Fatima earnestly besought her to keep this a secret from Bikur, as though he was a brave man, he might be afraid of encountering a wizard. Yariifa vowed by the Prophet and his beard, that she would religiously keep the secret. She begged for a sight of the casket, which was shewn to her. Being highly polished, she took it for silver; but when she found that the point of a dagger would not penetrate it, her jaw dropped, and when she saw the mysterious lock with its unknown mysterious marks, her awe was indescribable.

Being seen soon after in close conference with Bikur, we suppose that she told him everything. And his manner for the next few days was full of a certain importance, mingled with a ludicrous sense of injury, which I pretended not to notice. He took occasion also to convince me that he was perfectly brave, and not afraid of Sheitan or any amount of afrits (evil genii).

On the twenty-first day of our wandering, land appeared on the left. We approached it about midnight, and examined it curiously. It was a range of barren sandhills of no great height, as desolate a place as I ever beheld. The water broke with considerable violence on the beach, and we could not have landed had we desired it ever so much. The sight of land so filled our hearts with gladness that Fatima and I returned thanks to Almighty God for his continued mercies.

Next day the weather changed. Thick clouds gathered rapidly overhead, and the wind swung around to the south-east. This was the worst quarter it could have blown from, and as it increased hourly in violence, I ran in towards shore. Before we could well make out what kind of a place it was, the rain came down in sheets, and I was forced to batten down the hatches. We lowered the lug-sails, hauled down the jibs, and tried her weatherly qualities under the foresail. The pirogue behaved capitally, and struggled against the head-wind like a beauty, riding easily over the biggest waves. Bikur, I am sorry to say, did not maintain his character for courage, and at every wave that combed over our little bark, shouted upon Allah in a most fervent manner.

Fatima, who had ever a most undaunted spirit, did not bother me by coming on deck or lamenting, but brewed the most delicious coffee and sent

it up every hour. As we could hardly see where we were, so pitchy were the skies and so fierce the rain, I was compelled to keep the pirogue under way by a series of short tacks.

Bikur, to whom I intrusted the sheet of the foresail, behaved most wretchedly, and I was forced to threaten to pitch him overboard if he didn't shew more courage. The fore-sheet escaped on one occasion from his trembling hands, and I was obliged to summon Fatima to take the wheel, while I went to the blunderer's assistance.

It kept on in this fashion for about twelve hours, the pirogue rising on every wave and shaking herself like a seabird. There was no fear of her so long as we could keep her head to the waves. About ten o'clock next morning the weather slightly moderated; and as we were not far from the coast, and there was a whitish appearance about one part which made me think it was the mouth of a river, we hauled up our lug-sails and turning the pirogue's head directly for it, were soon riding in smooth water. Pitching out a little grapnel, I then tumbled down-stairs, and was soon fast asleep in my hammock.

I awoke about three in the afternoon. Fatima had slept too, and I believe there had not been an open eye among the crew. We longed for fresh food, our provisions having consisted of nothing but rice, curry, and salt meat; so with a view to testing the qualities of the fish in our new waters, we prepared our fishing-lines, and soon had a plentiful mess of fine fish, something like carp, only with horny appendages to their lips like an immature beak. Under the skilful cuisine of Yariifa, they proved excellent eating, and we packed some in a water-barrel, for after-use.

The wind was still boisterous outside, but in our snug haven we rather enjoyed it than otherwise. The rain came on again towards nightfall, and lasted for many hours, accompanied by tremendous peals of thunder, and lightning terribly vivid and incessant.

When the wind went down we judged it on the whole advisable to go higher up and try to secure some fresh meat. The pirogue was left in charge of the women, and Bikur accompanied me in the sampan to the shore, which was wooded heavily, the trees coming right down to the water's edge. Securing the sampan to a fallen tree, we started on our hunting adventure. We found the forest did not extend far inland, for we soon came to a plain undulating with hills and valleys, and adorned with broad clumps of trees. There were no signs of man, and the animals that frisked past us did not seem afraid. They were mostly a large kind of rabbit, but the gun I had brought being loaded with ball, I did not care to fire at so small an object. There were also strange little creatures, just like miniature kangaroos, and when they hopped on their hind-legs their motions were grotesque in the extreme; their eyes and heads were just like the English black rat, and their movements were so peculiar that I heartily wished I had brought Fatima to enjoy the sight.

We had just climbed a low hill, when Bikur gripped my arm: 'Look there!' he cried. 'Surely this is the land of afrits.'

Bikur's countenance was so pitiful, and betrayed such a longing to retire promptly upon the sampan, that I could not help rallying him upon his fears. I turned to see what had frightened him, and saw

something curious indeed, but not frightful. There was a herd of kangaroos—a big fellow, two females, and three little ones. The male was higher than a man, and was a colossal likeness of the rat whose antics had amused us. Entering into Bikur's thoughts, I could understand his fright. Fatima's story of the enchanter had taken full possession of his superstitious soul, and he evidently believed that the kangaroo was an afrit which had suddenly increased in size, like the cat in the *Arabian Nights*.

I thought it best to keep this delusion in his mind, so baring my head, which in the East is considered an act of desperation, and screwing up a look of the most intense emotion, I muttered some lines of doggerel improvised for the occasion, with the intonation of a sorcerer. Then drawing a circle on the ground, I suddenly dropped on one knee, and aiming carefully, fired, sending my ball clean through the heart of the big fellow. Bikur, who during these proceedings had fallen on the ground, and was invoking Allah with commendable energy, jumped to his feet and ran up to the fallen demon. Drawing my canjeer, I soon skinned and quartered our prize, and selecting the choicest morsels, packed them on Bikur's back. With this game we returned in triumph to the sampan, and boarding the pirogue, reported progress to the delighted women.

My slave Bikur, who had up to this point served me tolerably well, began now to shew symptoms of insubordination. To his unsophisticated mind, the slight adventure on the island together with my cabalistic movements, had wrought a fear which the poor fellow strove but ill to suppress. He implored me to return to Gizereh, owning that he had not courage to go through with any further adventures. But I told him that retreat was impossible, and that a courageous heart was the only thing that could serve him. If he faltered, he would peril the safety of all. If he persevered bravely, then I would reward him richly.

The wind moderating during the night, and shifting to the north-west, I took advantage of the tide, and set sail once more. We were soon clear of the river, and steering down to the sweet south.

CHRISTMAS—ITS CUSTOMS AND ASSOCIATIONS.

In furry pall yelad,
His brow encircled with holly never sere,
Old Christmas comes to close the waning year.
BAMFFYLDE.

THE festival of Christmas, associated as it is with the annals of the Christian world, will always merit our consideration, whether viewed in its religious or historical light. Extinct as the stately ceremonies of the festive by-gone times have become, and tame as the season now is compared to the hearty jollity of our ancestors, still there is a pleasurable thrill of interest when it annually recurs, and when we look back to review the ancient customs with which Christmas-tide was bound up, and of which there are still lingering remains, dim though the reflex be.

In the reigns gone by, when the court festivities were being enacted, the hospitable character of the times pervaded the lower ranks, and the old English gentleman was to be seen at his gate dis-

tributing victuals to the poor, to cheer their hearts in the merry Christmas-time. Any reader of the well-known old ballad, *The Old English Gentleman*, will there see the exact state of affairs in both periods. The striking custom of adorning our houses and churches with evergreens, &c. is of ancient date, and we can see no abridgment of the practice. The principal traditional plants used in England, when the streets were also decorated, were the holly, the ivy, the laurel, rosemary, the box, pine, fir, and the mistletoe; and these are still in request. The origin of the 'Christmas tree' is also of ancient date, the custom having been preserved in Germany and Sicily, from the former of which countries it was introduced into England.

Carol-singing is entitled to a notice. It has been a custom in all countries to hail the Nativity with those sacred songs called *Noëls* in France, and the *pifferari* or Calabrian shepherds come down from the mountains, adoring at the shrines, and celebrating the religious anniversary with their rude song. In these days any wayfarer, in both town and country, having the organ of hearing, cannot fail to have his ears greeted with *The first good joy that Mary had, There I saw three Ships come sailing in*, and the like. A glance at the Christmas-days must not be forgotten, and taking them at the commencement, that of St Thomas (January 21) is the first. This day is distinguished by several remnants of ancient customs. One of these customs is called 'going a-gooling,' or wishing 'good-even,' and remains in some parts of Kent; it consists in women going from house to house with sprigs of evergreen and begging for money. This practice is called in Herefordshire 'Mumping-day,' and in Warwickshire 'Doleing-day.' The musical procession in the Isle of Thanet, once known by the name of 'hodening,' the remnant of an ancient Saxon festival, and which is identical with the old practice of the 'hobby-horse,' or Roman sword-dance, was another of the customs of the day. On St Thomas's day, 'cock-fighting' was the great amusement of the people in the city of London; but that sport has happily now departed.

No special customs seem noticeable from this day to Christmas-eve; but the following is an extract from Burton's *Anatomy of Melancholy*, giving a list of the Christmas sports of times gone by, and of which we have still relics: 'Cards, dice, shovellboard, chess, the philosopher's game, small trunks, shuttlecocks, musick, masks, singing, dancing, jests, riddles, mer y tales' &c. We have also mention of jugglers and jack-puddings, 'post and pair,' 'hot cockles,' and other games of the same obsolete description.

The acting of the play of *St George and the Dragon* was long one of the delights of the season, and this leads us to the 'pantomime' of our day. It seems that we have the pantomime from Italy, where it was formerly maintained in its best and most entertaining way, and ours is but an inferior and mock representation of it. The characters can be traced to heathen divinities; the harlequin to Mercury, the columbine to Psyche, the clown to Momus, and the pantaloons to Charon. But in spite of the degeneracy of the spectacle, we find the pantomime one of the greatest amusements of Christmas. Christmas-eve is essentially connected with religious feeling; and although the spirit of festivity is observable on the night, a halo of

superstition seems to be around. But independently of this, the world at large has always been, and indeed still is, intent on preparing for the good cheer of the morrow; the streets of London, the markets of Leadenhall and Smithfield, decorated shops, and people being alive with pleasurable business. The great bird the turkey, the roast beef of Old England, and the brawn, are particularly displayed to great advantage.

Brawn is a dish of ancient Christmas antiquity, made principally in Canterbury, and is mentioned in the Christmas breakfasts of brawn, mustard, and malmsey of Queen Elizabeth's reign. The 'Yule clog' or 'log' was a great feature in the Christmas customs in the olden times, and is still lighted in some parts on Christmas-day. It was once the custom to kindle the log with the last year's brand, and was first placed in the middle of the hall, and not suffered to be thrown on the fire till each guest had sung his Christmas song. The 'Christmas candles' with their wreaths of evergreen originated in the former name of Christmas, 'The Feast of Lights.'

On Christmas-eve, oxen are said to kneel in their stalls, the bees 'sing' a Christmas hymn *en masse*, the cock is stated to sing all the night through (mentioned in Shakspeare), and bells are supposed to be heard from under the earth.

At last the 'Day of Days' arrives, a day on which, in spite of ourselves, religion enters our thoughts. Christmas-day should not be an idle day of revelling or a chilling day of strict religious formula, but one when heart and soul work together to appreciate the words of the angel, 'Peace on earth, good-will towards men;' a day ever memorable as the advent of the Saviour of the world, and therefore ranking as the greatest of our festivals.

How different indeed does the enlightened scene present to the coarse *delights* and the atrocious cruelties performed at the Saturnalia and festivals of that kind. Even the Christmas customs of Christian England centuries ago, must not be regretted, since they have passed away; many, if persevered in, would be utterly inconsistent with the times and antagonistic to the march of reason and progress; therefore we bid them farewell; not insensible, however, to a certain influence for good they had, in establishing in the minds of men a veneration for God, a love of the picturesque, and promoting a union of rich and poor, each class holding forth the hand of fellowship, at least for a season.

We can never be oblivious of the 'signs of the time' as the festival comes annually round. The preparations that proceed on all sides in town and country, both domestic and commercial, cannot but impress us that there is an additional bustle as Christmas approaches. Much havoc is spread in the poultry-yards, anticipative of the good cheer that is, at least in these days, one distinguishing mark of the time; and the city is occupied in the reception of the good things of the country, indeed warring us with all external signs of the festive season. At home, families are engaged in the manipulation of the mince-meat to be afterwards applied to the pie. This dish of fable has been supposed, from the spicy ingredients of which it is composed, to have a reference to the offerings of the Wise Men of the East; but being anciently made in the shape of the manger

of Christ which gave rise to Puritanical objections, it was condemned as idolatrous. However shorn of its religious associations, it has come down to us as a toothsome delicacy, and is partaken of freely by all. But to resume. Take a glimpse of England in the days of the stage-coach at Christmas-time, and then what an animated spectacle presents itself! The road is alive with passengers and vehicles of every description; and among the former, the most striking are the returning schoolboys, notably those from Winchester, chanting snatches of their song, *Dulce Domum*, breaking forth jubilantly in their emancipation, and their hearts full of the feelings of joy at the thought of the coming delights. The famous Norfolk coach laden, nay well-nigh overwhelmed, with the poultry of the country, on its way to London, must have been a most suggestive sign of the time, being itself at once the herald and conveyer of the festive turkey, the future smoking tenant of many a board.

A word on the host of observances of Christmas-day. Would not the juveniles of this age at once rise in an indignant conclave to protest against the omission of the subject of 'plum-pudding!' This dish was once called 'the hackin,' presumably from the chopping that is necessary; and as dinner was generally served in ancient times at one P.M., an old book says that 'the hackin must be in boiling by daybreak, or else the cook must be run round the market-place by two young men till she is ashamed of her laziness.'

It appears that about the reign of Charles II. the name of 'hackin' was disused, and that of plum-pudding took its place. Plum-porridge, probably very much akin to the pudding, is also of very ancient date. The story of the French king wishing to give the English ambassador a specimen of our national dish, is perhaps not known to all. A good recipe was obtained by the king and given to his *chef*, and all directions were carefully attended to, but—the cloth was forgotten; and when the time for the Christmas banquet arrived, the mess was served up in tureens, after the manner of soup, to the surprise of the Englishman.

The boar's head, soused and garlanded, carried on to the table by a retinue of servants with minstrelsy, was a great feature in the Christmas programme in England; and once the peacock held the place of the turkey of the present day. The famous boar's head carol of *Caput apri defero*, &c. is still sung at Queen's College, Oxford, on Christmas-day. The old baronial hall crowded with guests, minstrels, and serving-men; the tables loaded with the different good cheer; the servants' hall, where the 'vassals' made merry, must have been a striking sight; and then the mistletoe bough, the dance, the wassail bowl, the song, the jest and other amusements, completed a thoroughly jovial day.

Christmas-day as it now exists requires but little description. Perhaps the feature sustained with the greatest fervour is the Church service. Hospitality too may not be extended in the same open fashion as in former days; but the poor are not wholly forgotten in our streets, unions, and hovels, although, alas, the name of Christmas is a mockery to myriads of uncultivated minds. The Christmas-day of these times is, as we know, for the most part a family gathering of relatives and friends,

the seasonable dinner, appropriate to the occasion, finishing off with dancing, and perhaps a few improvised games for the younger folks.

What we have said here regarding Christmas, of course chiefly refers to England; but many of the hearty old usages of the day along with religious ordinances pertain to all Christian countries on the continent of Europe, and to colonial countries settled by the English. We would indeed say that a semi-religious, semi-festive attachment to Christmas is about the most extensively preserved of English institutions. Wherever you find an Englishman, there you find less or more a remembrance of Christmas, with its pleasant and beneficent usages. The force of example has begun even to affect Scotland, which, under Anglo-Puritan tutelage in the seventeenth century, threw off Christmas and other ecclesiastical holy-days, as being calculated to infringe on the due reverence of Sunday. Throughout Scotland, and more particularly in Edinburgh, the English festive usages incidental to Christmas have made immense progress within our recollection. In short, there are now to be seen the same kind of family gatherings, entertainments, and decorations with evergreens on the north as on the south side of the Tweed—a striking melioration of long clung-to prejudices. In Scotland, however, as is well known, Christmas-day has no legal sanctity, and most industrial occupations go on as usual.

'Boxing-day' or St Stephen's Day must be slightly noticed. As it is the custom to send cards of good-wishes to our friends on Christmas-day, so it is the custom to give 'Christmas-boxes' or presents on this day. The origin of the term 'box' is derived from the actual box once kept on board ship for the reception of offerings for the priest who performed masses praying for the safety of the ship and its crew. In consequence of the poor begging of the rich for contributions to the boxes, the name of 'Christmas-box' became established, and gradually, as we shall presently have occasion to notice, grew into the sense we now use it. One of the chief customs in Ireland on St Stephen's Day is called 'hunting the wren.' It consists in the 'wren-boys,' as they are called, bearing from house to house one or more wrens in a bush of holly ornamented with ribbons, the birds having been previously hunted and killed. Of course a small donation is expected from the inmates of each house visited. The origin of this cruel custom is from a fable that the birds asked for a king who flew the highest; of course the eagle did so till exhausted, when a wren, fresh in his small strength, started up, outflung him, and was crowned. The wren is, however, hunted and killed by the Irish because of a tradition that once by picking some crumbs left from a supper, it aroused the sleeping drummer of a Danish army on which the Irish were about to make a surprise attack, and would have probably routed the sleeping enemy. 'Hunting the wren' is also a custom to be associated with the Isle of Man, where indeed, accounts tell us, much mock-solemnity was performed in killing the wren, laying it out, bringing it to the parish church, and other rites.

New-year's-eve at length arrives; no special customs distinguish it, except it be the 'sitting up' till midnight, that we may usher in the new year, full of new hopes, although often tinged with

regrets for the old one. New-year's-day, a day for gifts, and Twelfth-night, a night of 'characters and cake,' and on which the faded evergreens are taken down and burnt, complete the Christmas season. Once indeed there existed, in the time of 'flax-spinning,' a festival known by the name of 'St Distaff,' the patron saint of spinning. The holiday fell on the 7th of January, and was strictly confined to the rustics. The sport was of but short duration, it being one of the conditions that the men should work part of the day. The amusement participated in it was somewhat rough, consisting of a sudden onslaught by the men on the flax and distaffs of the 'maides,' who, in retaliation for their burnt and burning domestic necessities, severely soused their assailants with pails of water. This day is now obsolete as a festival, but it was most emblematical of the extinction of the lights of Christmas, until the season again made its appearance.

It is much to be regretted that what was formerly held to be a happy social reminder of our existences as families and friends, should have latterly so mixed up with it, the matter of pounds, shillings, and pence. Year by year has the evil been growing in England, as in America and France, of making Christmas and New-year time, with their attendant joviality and open-heartedness, the vehicle of a system of social bribery and corruption which bids fair to assume serious proportions. The cunning but too frequently prey upon the simple, the mercenary on the benevolent; and the young family-man, just struggling into a position in life, can anticipate with no unalloyed delight the season when he will have to pinch his family and himself in order to satisfy the demands of a body of men who have done but little for him during the past year, and who will relapse into their normal state of insolent independence so soon as their claims have been gratified. We allude, of course, to the system of indiscriminate Christmas-boxes.

Not very many years ago, an interchange of presents between members of families, or perhaps in certain cases between the master and his servants, was all very pleasant, and all that was demanded; nowadays it has become a perquisite of many who are brought in contact, however remote, with a family, to claim not as an indulgence, but as a right, rewards for services never performed. Not that we advocate the entire abolition of the Christmas-box system; far from it. There are certain toilrs and workers with whom, in our social and business life, we are brought in contact who are really deserving at Christmas-time of some recognition of services rendered during the past year; but we cannot shut our eyes to the fact that from what was originally a beneficent institution has sprung a custom which is now claimed as a right by many who in reality have no claim at all.

Present-giving amongst friends and relations is also no longer what it was, and has in fact ceased to be present-giving at all, but has degenerated into a great social competition between Smith and Brown as to who can outdo the other in extravagance. The child of 1876 sneers at the toy which would have made his or her parents jump for joy thirty years ago. Money which would gladden the heart of many a poor relation, is now expended in gorgeous gimcracks for children, bought but to be

criticised with precociously keen eyes, and probably destroyed a few hours after presentation. One need but walk through one of the great London bazaars at Christmas-time to find the proof of this. Another evil is the increasing extravagance which characterises modern juvenile Christmas entertainments. We were going to use the good old-fashioned term, 'parties.' Cosy and comfortable little reunions of children, where dancing and romping might be indulged in *ad libitum*, and without the restraint of etiquette and so-called 'propriety,' are gradually becoming unknown. Master Brown, stiff and stark in shirt-front and white tie, sips his champagne now, and would turn up his little nose at the negus and elder-berry wine which were considered good enough for his forefathers. Miss Brown does not know how to romp, fills up her card of engagements, or walks through the quadrille with a carefully selected partner, with the same stately formality with which our ancestors of the last century would have walked through a minuet or coranto. Neither do Master or Miss Brown care much for the dash-and-tumble business of the harlequinade at the pantomime; and the decorous deportment which greets the well-worn tricks of clown and pantaloons at Covent Garden and Drury Lane, is, we fear, the very shadow of the boisterous merriment that was so pleasant an adjunct to the Christmas pantomimes of old.

Perhaps it is, that sensitiveness to criticism and ridicule has become more than ever a national characteristic, and that Mrs Grundy, although we affect to laugh at her, has nevertheless become more than ever a powerful sovereign over many of our actions during the festive season of Christmas.

AN OLD MANUSCRIPT.

IN THREE PARTS.—PART I.

THE following brief incidents are gathered from the pages of an old forgotten manuscript written by a lady who died more than half a century ago. It is also certain that all the persons chiefly mentioned in the narrative have long since passed away. The manuscript, therefore, is transcribed very nearly in its entirety, with a few obvious substitutions of fictitious names of people and places. It runs thus:

The story of my life opens in the year 1814. I was nineteen years of age when the chain of circumstances began which led me swiftly, through five short years of great misery, of deep, deep happiness, and of heavy sorrow. This was my life. My childhood is to me, now, a blank; my early girlhood a thoughtless uneventful period of little joys, little vexations, and little aims. I lived like others of my age, tenderly cared for and protected from harm, and in that mild home atmosphere I was happy, for I had not imagined a future.

I am now, God helping me, living, I trust, as a Christian woman should; but my life is dead. I am young still, very young in actual years; but the veritable days of my youth have passed from me, never to return. Heaven grant me that my reason fail not in my great sorrow, for sometimes I feel that I must succumb to it.

O Arthur! my dear lost husband, if at times the angels hover near those they love on earth, pity me, and pray for me, your still suffering and remorseful wife! My darling! as thy great heart too generously forgave in our mutual life, so let thy beloved memory dwell with me sleeping or waking always, until I may be with thee where all things are purely revealed, and no shadows come betwixt love and love.

Let me go back in thought to that time—so long ago it seems—when I lived with my dear kind old uncle and Aunt Rawlings at Belford Row, London (my home from infancy)—to that day when an incident occurred of a letter received from an almost unknown friend of our family in a distant county; a letter addressed to my uncle, but which related chiefly to me. And little did I think at the time how much that letter was destined to influence my life—a life that my foolish girl-mind had thought so uneventful in its nineteen unvariable years. I well remember what a comedy we made of its reading, my cousins and myself; how we guessed, wondered, guessed again, gave it up; and still guessed, wondering and conjecturing. The letter was dated from a village in Northumberland, and signed 'Richard Stanhope.' It communicated to my uncle the death of the writer's only son, who had been a brother-officer and dear friend of my father; and it also contained a warm invitation for me to visit him at his lonely vicarage.

'I knew Captain Stanhope very well years ago,' said my uncle, after reading the letter aloud to us a second time.—'He served abroad with your father, Rose. They were schoolfellows. What do you think about the invitation, my dear?'

The answer I made to my uncle was ready-made. In fact, before he had finished reading the letter, my mind was travelling by anticipation to the north; so I said at once: 'Uncle, I will go to him. It is my duty.'

My cousins looked very blank at this sudden determination, and so did both my uncle and aunt, for a more united family never existed than we were.

My uncle, I soon found, was very much against the idea of my going so far away. Indeed the whole family thought and talked of little else for days but the strange letter from Northumberland. For myself, the more I thought of it the more I persevered in my resolution to go. I had strongly persuaded myself that I owed this duty to the memory of my dead father, whom I could just recollect; but I fear it was more the impulse of curiosity and desire for change that inspired me. A craving for adventure also pursued me. I only half believed the many strange tales that were poured upon me about the rude wild life and manners of the dubious region that lay on the southern Borders of Scotland; but I knew enough to shew me that whatever awaited me there would be almost altogether foreign, and unlike my previous experiences of life. So, about a week after the receipt of the letter, my uncle, after much consultation, wrote a reply, saying that within a fortnight I should set out on my journey northwards.

What a fortnight that was for me! My giddy head was so full of speculation on one theme—my visit—that all things else were reduced to

nothingness in comparison. Often do I look back regretfully on my selfishness at that time, as my traitor imagination lives over again the past—the sad, sad past, that seems so like a dream, and yet is so real. My poor cousins were wild with grief when the time of parting came. My uncle and aunt too, although less demonstrative, were so much distressed that I almost gave in at the last moment. But something beyond my own will seemed to control me, and with the transient thought of yielding came rapidly a strong-set resolve to adhere to my determination. I was indeed surprised at myself, at my own courage and energy in the matter.

The good-byes were said at last, and I was seated with my uncle in a hackney-coach which took us to the mail-office; and the last sight I saw of that dear home, as I was driven off, was the struggling figure of my little cousin Ned breaking away from the others on the door-step to rush after the coach, calling out for me to come back, calling out 'Rosy, Rosy!' with such agony in his fresh young voice as was very painful to hear. I remember I shed tears all the way to the coach-office, and long after I had left London and Islington far behind. But by degrees the novelty of my situation and the opening views of the fresh beautiful pasture-lands of Hertfordshire calmed down my grief, although I carried a heavy heart with me many miles of my journey.

It was in the early summer-time of the year, and everything was especially delightful to me, for I had scarcely ever been out in the real country before. My fellow-passengers were pleasant and agreeable, and so the time passed very enjoyably. I always had great capacity for happiness, and the little unfamiliar roughnesses of the journey hardly told at all on my young healthy frame.

Early in a forenoon I was set down at a repulsive-looking inn at Newcastle, where I found a man with a conveyance waiting for me. Then we drove some miles through a most depressing country: coals and smoke everywhere, until we turned westward. The road then lay amongst pleasant green hills and valleys for some five or six miles more before we reached our destination. And glad I was, I remember, for I was beginning to feel very lonely in company with a wild-looking old man, who only stared and grunted whenever I attempted anything like conversation with him.

When we drove up to the vicarage door I thought I had never seen a place so delightful and home-like. It was a small irregular building, partly two-storied and partly three-storied, and smothered to the eaves with ivy and roses, with pigeons cooing on the roof and fluttering, as if wooing me to their cosy dwelling-place.

Mr Stanhope and his sister met me on the threshold with a welcome that abundantly atoned for the savage demeanour of the taciturn old groom, who at the moment rushed rudely in, throwing down my luggage with a sort of gasp, and then rushed out again with a very scowling face.

'You must not mind old Mark,' said Mr Stanhope, smiling at my disconcerted looks. 'He is an original, and the only man in my parish who takes the trouble to criticise the sayings and doings of the parson. He is worth a dozen of ordinary people.'

I felt at ease instantly with Mr Stanhope, and

liked him at once. A kind, genial, white-haired old man, with one of the handsomest faces I ever saw. A face with real benevolence in it, and *gentleman* written on it in every reposing line. Miss Stanhope was an elderly lady, younger than her brother, and kind too in her own way; but she did not seem so genial as Mr Stanhope, which made me feel a little shy with her at first. I was shewn into the queerest old bedroom I had ever seen. It had twice as many corners as a London room, and I fell in love with it at once. It was full of fresh pure scents, and clusters of red and white roses were nodding and smiling at the open window. I liked Mr Stanhope more and more as we talked together in the evening; Miss Stanhope sitting by knitting, but now and then putting in a word in her own quiet reserved way. I thought her somewhat cold and strange; but I had reason to know her better afterwards. And this was the case with many kind loving people that I met in Northumberland. Indeed, to be reserved is to be Northumbrian. But Mr Stanhope was very different. He had lived all the younger part of his life in the south; and him at first sight I dearly loved, and so did I always afterwards and ever shall to the end.

I shall now continue my story in a different way, and in a manner that will best convey the impressions of that part of my life which immediately followed my coming to the north.

My uncle on parting had put a blank-leaved book into my hands, and half-jokingly desired me to make it my diary, so that we should afterwards have pleasant readings of my visit to Northumberland. I determined to do so; and I find that, although it is frequently written very frivolously and with recurring intervals, it is sufficiently copious to continue these imperfect annals. I therefore add it to the preceding pages, just as it was written five years ago.

MY DIARY, FROM MAY TO SEPTEMBER 1814.

May 14.—I was up this morning literally with the lark, for I could hear him singing in the clouds just as the earliest rays of the sun were slanting along the sky. How happy his song made me. I had never before heard such long sweet delicious notes. I knelt at my open window and listened a long, long time. Then I shook the dew off the bright roses that were clustering all about my head. *Mem.*—I shall call my room *Rose-chamber*. *Mem.* 2.—I never cared for my own name till now. Sweet Rose! I wonder what is the masculine of Rose? Perhaps Thistle!

When the clock struck seven I ran down-stairs, and out into the garden, and whom should I see but my queer old charioteer sweeping the garden-walks. I pretended not to see him at first; so he crossed his hands upon the broom-handle and rested his chin on them, staring at me from beneath his sluggish eyebrows. Then I passed close by and said: 'Good-morning; what a beautiful morning it is.' To which he replied: 'We'll ha' rain afore night;' and then recommenced sweeping the gravel with such slow determination that I saw it would be in vain to attempt any more conversation just then. So, to avoid being swept from the path like a stray rosebud, I walked on, and bided my time, for Mark is clearly a character.

I had a long ramble through and through rose-beds, up and down long laurel-walks, and finally out into a field among some sheep, a pony, and two cows, all of them staring at me just like Mark. The pony came close up, stretching out a long neck and sniffing at me. Then he sprang away, and galloped twice round the field, and stared again. But the cows never moved. I patted one, whereupon she turned her head and licked my hand with a tongue like a file. The suddenness of the action startled me; I screamed out as if I had been bitten, at which the pony galloped round the field again and screamed also, and kicked up his heels. Then I considered it prudent to retreat into the garden, where I again encountered Mark standing grinning over the fence. I gave him a scornful glance for his cowardice in not running to my assistance, and watched him go into the field, making up to the frisky pony with a halter and a thing with corn in it. The cunning creature looked sidelong at him for a moment, and then trotted up, and was haltered without a struggle. Then the deluded prisoner was led in with a subdued look in his big brown eyes, that made me quite pity him, in spite of his late improper behaviour.

I came in to breakfast very hungry; and, oh, the cream! Mr Stanhope was greatly amused at my raptures; and I found that, old gentleman as he is, he had not forgotten the compliments of his youth. He advised me always to take a scamper before breakfast. *Mem.*—I like him so much.

May 15.—After luncheon to-day Miss Stanhope and I went out for a drive, with a certain sly hypocrite in harness, looking quite meek and thoughtful. We drove through long lanes with the may sparkling on the hedges, and through a village of thatched houses. They looked so romantic; but Miss Stanhope said they were quite damp and unpleasant to live in. They had queer little windows with red flower-pots in them, and shy faces behind those, peeping at us. A little boy ran out of one of these cottages and threw a stone after us; then he fought with his mother, and finally escaped up a tree by the roadside. 'What a little wretch!' I exclaimed.

'Oh, that is nothing!' said Miss Stanhope calmly. 'He sees that you are a stranger, and they always do so before strangers.'

Then we made a call; my first call. We stopped at a pair of old iron gates by the wayside, and passed through between two gigantic moss-grown stone pillars, each of which had a large stone raven on the top, also moss-grown and very uraveulike; then up a long weedy avenue, beneath some beautiful old chestnut trees, all in bloom, up to Selwyn Grange. What a queer old house it seemed, all grown up with ivy, but no roses, and little windows like dungeon-windows, if dungeons have any windows. The door stood wide open, and as Miss Stanhope rang the bell, I could see into a long, low entrance-hall all hung round with antlers and rusty spears. A sad-looking old man-servant appeared, and led us in very mournfully, I thought.

It was as cold as ice out of the bright sunlight, and my heart sank in spite of me, and a strange shudder crept through me. We were ushered into the drawing-room; and before I had time to look about me, in came a young lady, who ran up to

Miss Stanhope and kissed her. 'This is Miss Rose Wilfrid, Edlie,' said Miss Stanhope. We shook hands, and in five minutes the gloomy old hall was forgotten. How beautiful she looked! I had thought my cousin Mary Jane pretty, but here was beauty. Not mere loveliness, but real artistic beauty. I could not keep my eyes from off her, quite forgetting good manners, until she recalled me to myself by asking some direct question about London, which she had never seen, she said.

Then I told her all about my town-life and the fashions as much as I could, and as much as I knew about the good old king and poor Princess Amelia. Suddenly the door opened, and in walked a tall stately lady, full dressed, mittens and all complete. She politely saluted Miss Stanhope, putting also a cold hand in mine, making me shiver again.

'Mamma, this is the Miss Wilfrid that Mr Stanhope told us all about.—How glad he will be to have you staying with him,' Miss Selwyn said, turning to me.

But the stately mother said very little; and the conversation gloomed and flagged till we rose to go, and Miss Selwyn came out with us through the brooding hall. Then it was all sunshine again. What a picture she made standing there upon the doorstep, watching us drive off, with all her bright brown hair waving and glistening in the sunlight, and her blue eyes sparkling, and her face all dimples and smiles! What a contrast to her mother, who is as dark and silent as night!

'How strange Mrs Selwyn is,' said I, as we drove down the avenue.

'Hush, my dear,' said Miss Stanhope rather nervously. 'I'm glad you like Edlie. I'm sure every one does who knows her.'

'But about Mrs Selwyn?'

'Oh, you must not seem to notice her peculiar manner. She has had great troubles, and has not seen the end of them yet,' said Miss Stanhope, lowering her voice mysteriously. 'The Selwyns are a strange race. They have always had much unhappiness in the family from generation to generation. Now you must not ask me to tell you any more about it,' continued Miss Stanhope, touching up the pony as she spoke, for he had by that time sunk into reverie and was walking quite pensively.

Mem.—To find out from Mr Stanhope all about the Selwyns making one another unhappy, and how they do it. *Mem. 2.*—Not one young gentleman have I seen or heard of yet. But Mr Stanhope told me at dinner to-night that a new curate is coming soon.

May 18, Sunday.—We all went to church twice to-day. How delightfully Mr Stanhope preaches! What calm noble thoughts! How soothing this is, after Mr Ghasp of Tottenham Court Road, who makes one feel so uncomfortable about bad things. Mr Ghasp is not a gentleman of the same order as Mr Stanhope.

There were five working men and three old women at church in the morning, and the same old women without the men in the afternoon. Miss Stanhope says that dissent is the cause of this. A new chapel called 'Zion' has been built in a neighbouring village, and that draws the people, excepting a few who desire blankets at

Christmas. Oh, how horrid this is. And such a lovely old building as the church is, full of grand Norman arches and old monuments. I saw one about Colonel Prideaux Selwyn, who lived in the time of Charles I., and fought for his king. But some of the inscriptions are much older and quite illegible; like *Latin*.

Mr and Mrs and Miss Selwyn were at church in the morning, and I was introduced to Mr Selwyn. He is a pleasant sort of gentleman, not at all wicked-looking; so it must be the old grandfather at home who works all the mischief in the family. Euphemia is like her father. We had a long talk in the porch, and she told me all about her brother. She has only one, and he is handsome. She is very fond of him. I should think so! Who would not be fond of a good-looking brother? I was also introduced to the Cessfords; but the men are boobies and the women silly. No good looks there. Mr Gavin, the eldest son, stared at me all through the Litany with his large mouth wide open, just as the common people do.

How peacefully we spent this Sunday evening! Mr Stanhope read us one chapter; that was all. Not like my dear good uncle, who is a Methodist, and used to disturb us greatly on Sundays. Here it is all very different. *M.m.*—I am Church of England to the backbone.

May 25. I have not written in my diary for a whole week, so busy have I been. I now resume. The new curate, Arthur Salkeld, came yesterday, and he preached this morning instead of Mr Stanhope. I didn't like his sermon. He preached in a black gown and without notes. Mr Stanhope says that doesn't matter; but I think he is a little too easy in this. And then the sermon was full of hits at people. How he guessed so very near the truth sometimes, I cannot make out. Effie don't like him either. She dined with us last night, on purpose to meet him, and we were both of us much disappointed. He is not a ladies' man at all, although young and not bad-looking; only very haggard, which is perhaps caused by insufficient food in lodgings. But Effie thinks he must have been crossed in love. Miss Stanhope thinks him quite a model young man, earnest and thorough. He has good eyes, by the way, but he never fixes them on anyone in particular; he always seems to be looking over one's head and far away; he is unnaturally grave. Effie tells me that her brother at college is also called Arthur, and that he is over six feet in his boots.

May 28.—Just arrived home, under the wing of Mr Salkeld, from a dinner-party at Selwyn Grange. The Boobies were there and the Misses Cessford. Effie says Gavin Cessford is a great catch, but unfortunately uncommonly stupid. I know nothing of the former, but I am quite sure of the latter. It is no proof of his stupidity, though, that he is deeply in love with Effie. Who wouldn't, the darling? (Effie, I mean.)

I begin to like Mr Salkeld a little more; that is, I have more respect for him, as Effie says he is decidedly clever—the cleverest she ever met. There is no posing him, for if you talk small at him he doesn't reply; that is, he doesn't reply small. And on great subjects, such as theology or agriculture, who but he with a learned tongue! I begin to be a little afraid of him. He is twenty-five years of age, and an enigma.

What nonsense it must be about the wicked Selwyns. A more genial host than Mr Selwyn I could never wish to see. Mrs Selwyn was politely austere to everybody. She never smiled. I watched her. And how she fixed her large black eyes on Mr Selwyn every now and then as he guily took wine with everybody, including me!

During the evening, Mr Gavin Cessford sang *Barbara Allen*, with Effie playing for him. He sang it with great pathos, and never took his eyes from Effie's face, which did not at all disturb her, as I feared it would. Then Effie sang *The Flowers of the Forest*; and an old gentleman, who took a deal of snuff, said it reminded him of something, but he could not remember what. There is great charm in Effie's singing.

Effie and I were much provoked by Mr Salkeld's want of gallantry. And he drank no wine at dinner. Old Mr Selwyn, the head of the house, Prideaux (or Old Prid, as irreverent Mark styles him), sat by the fire the early part of the evening, never speaking, but quietly looking into the blazing coals and sipping a glass of wine-and-water, and occasionally chucking to himself, regardless of the company. He is a placid-looking old gentleman—very old—wearing a black velvet skull-cap and an imitation tie-wig. Neither does he look very wicked. The wicked one must be the absent grandson. Effie says he (the grandson) smokes. So does Mr Stanhope; but it is more dreadful in a young man, of course. I noted that the youngest Miss Cessford blushed when Arthur Selwyn's name was mentioned at table! Oh, ho, Miss Sarah Cessford! *Note.*—She is the plainest of the family.

June 1.—I peeped over a wall to-day and saw twelve beautiful young pigs as white as snow. It seems their mother is a widow as it were, for her husband has deserted her, after eating two of their helpless offspring. The atrocious monster!

June 2.—Mr Salkeld's character unfolds itself day after day. Miss Stanhope is right. He is, I am certain, a thorough Christian. He goes about doing good, and the people are beginning to come to church. Mr Stanhope, the dear old gentleman, is delighted at this. And there have been two conversions in the village: old Esther Mitchell, who would gather sticks on Sundays, and Thew Armstrong the miller, a rigid dissenter. There has also been a Sunday school started in the village, and I teach a class of little boys. Effie would gladly come to assist, but her mother seems to be against it. Mrs Selwyn, I have reason to believe, comes of the ancient Catholic family of the Clengys of Saxby.

Last Sunday, in my class, little Tommy (Graham) stood up and confessed a crime—stone-throwing. I was much pleased with this, and would have forgiven him at once; but Mr Salkeld advised me first to make the culprit promise that he would never more in future throw at anything, not even at dogs or little harmless birds. Tommy hesitated; his whole body seemed to hesitate, as he balanced himself unsteadily on one leg, stammered and shuffled, and finally ducked down and fled out at the open door like a wild animal. The class was filled with regret at his escape; I could see it in their little selfish faces. I was rather glad, although Mr Salkeld walked away with a deep sigh.

June 12.—My heart warms to Mr Salkeld in his good work. We are together more and more. Effie visits us very frequently, but she does not see him with my eyes. He is quite beloved in the village, for he is doctor as well as priest. He cured Betsy Scott's child of the cramp, and her husband came one night to the vicarage to thank him. He was out; but Mr Stanhope kindly gave the man a shilling, and told him to go home. But the poor fellow hung about the place until Mr Salkeld came, and then he could not thank him, but 'lost the day,' as the saying is down here; that is, he cried.

How Mr Salkeld seems to get to the hearts of these rough people! He has a kind word for every one he meets. They resented it at first, as a new fashion, for they are the shiest people in England until one gets at them. But when they came to understand that it meant friendship, as between a man and his fellow-men, they were his children, his very bond-slaves. Thus he is the king of hearts! Mr Salkeld would have taken Mr Selwyn to task about the wretched dwellings of the poor in the village; but Mr Stanhope strictly forbade him to interfere. Still, for all that, he more than hinted at it in his next sermon. Mr Salkeld says the Northumbrian peasantry ('hinds') were better off three hundred years ago than now. Note.—And he knows more than most people about every-thing.

June 14.—Mr Stanhope has often talked to me about my father and mother, who died within a year of each other, when I was five years old. But to-night he approached a theme he has hitherto avoided—his dead son. We were alone nearly all the evening, and the dear vicar opened his heart to me. He told me that he loved me as a daughter, for my own and my mother's sake; and that his son loved my mother, and she never knew it, for he and my father were like brothers; and he was true to his friend, although his own heart was nearly broken. Then, when the great war broke out, Captain George Stanhope went to Spain with Sir John Moore, and was one of the brave who fell by the side of their chief at the battle of Corunna. All this the dear old man told me so sally and tenderly that I could find no voice for sympathy, only tears. And when he spoke of the share his son took in the famous retreat, how his horse was shot and himself wounded, and how he still did his duty in the flying fight, till the fated bullet came that slew him in an act of heroism, caring for others, and never heeding his own danger—when the old gentleman related this, his eyes shone with a flash of pride, then instantly filled with tears, and a choking sob kept back the words he would have uttered. I threw my arms round his neck, and kissed him; and he held my head close to his breast, neither of us speaking for a long time.

June 20.—Mr Salkeld and I read together very much. What a noble understanding he has, and how pleasant it is to apply to him for advice! And to Effie's astonishment, he does not forbid novels. I am reading *Clarissa Harlowe*. But when Effie comes, it is all over with reading. The dear girl hates 'tasks,' as she calls our studies, and she has such charming wilful ways, that she is empress of us all. She never used to come so much to the vicarage until I came; and the vicar playfully reminded Gavin Cessford that he had scarcely seen him at his house since confirmation-time. And now Gavin

has learned the way of dropping in at all times; to meet Effie of course, who always affects surprise to see him. She laughs at him to his face, and he laughs too, just because she does.

THE COMMERCIAL TRAVELLER.

COMMERCIAL travellers have in the progress of industrial enterprise become a great institution in the country. Some years ago it was estimated that there were thirty thousand of them in the United Kingdom: men who seeing the world more than anybody else, are shrewd and intelligent, and without whose skill and activity it would be difficult to carry on the wholesale business of the country. Unlike tallymen, chapmen, pedlars, hawkers, and other house-to-house applicants for custom, they are the accredited representatives of large firms, having (for the most part) something of the stamp of the gentleman in their general habits of life.

Your modern commercial traveller is a very different being from the 'bagman' of old times who travelled about the country on horseback, with his saddle-bags stuffed with samples, and who lived a very jolly sort of life at the inns which he frequented. William Hutton, the quaint historian of Birmingham, has sketched the early history of commercial travellers in connection with the iron trade. Something still more amusing is written by Dr Aikin as to how the commercial-traveller system developed itself in Manchester and other seats of the cotton manufacture. Long before Arkwright had introduced the machinery which gave such a wonderful extension to this important Lancashire trade, the cotton manufacturer had been wont to work with his own hands; he had no capital, and sent out no agents; he was master and workman in one. Advancing beyond this stage, he worked as hard and lived as frugally as before; but, having saved a little money, he was enabled to employ this as capital for maintaining a stock of goods on hand, and to keep several apprentices. Sixty or seventy years before Arkwright revolutionised the trade, 'an eminent manufacturer of that age,' we are told, 'used to be in his warehouse before six in the morning, accompanied by his children and apprentices. At seven they all came in to breakfast, which consisted of one large dish of water-pottage, made of oatmeal, water, and a little salt, poured into a dish after being boiled to a thick consistency. At the side was a pan or basin of milk. The master and the youngsters, each with a wooden spoon in his hand, dipped without loss of time into the same dish, and then into the milk-pan; and as soon as it was finished, they all returned to their work.' Manufacturers of this class supplied wholesale dealers in London, Norwich, Bristol, Newcastle, and a few other large cities; but had no commercial machinery for establishing trade with dealers in smaller towns. By degrees, however, men possessing an accumulated capital of four or five thousand pounds began to extend their operations by sending out riders for orders throughout the kingdom. Chapmen, having gangs of pack-horses at their command, conveyed goods along tracks which no vehicles could have traversed; they exhibited these goods to shopkeepers, sold what they could, and

deposited the remainder in small stores at the inns. They brought back sheep's wool from the country districts, and thus transacted a double trade. The rider and the chapman represented two different phases of commerce, both existing at the same time; but the former gradually superseded the latter. When good roads began to be made firm enough for broad-wheeled wagons, there was no longer much need for pack-horses; and the chapman became a bagman, carrying samples of merchandise instead of the merchandise itself, which was left to be conveyed by the road-wagon. When, at a later period, the genius of Brindley had supplied the manufacturing districts with canals, still greater facilities were afforded for the transport of merchandise, and the pack-horse was only wanted in rural or out-of-the-way districts.

In all the great departments of trade, the commercial-traveller system grew up somewhat in the same way as at Birmingham and Manchester. At first, the manufacturers and the dealers were left to find out one another as best they could; then the dealer went periodically to call upon a round of manufacturers; then a commission agent made any number of purchases for any number of dealers, and charged a percentage for his services; then a chapman with a little capital, buying enough merchandise to load a train of pack-horses, carried the goods to distant towns and counties for sale; then the manufacturer, or a partner in his firm, at stated periods in the year mounted his horse and started off hither and thither, carrying samples with him and obtaining orders; then the manufacturer employed a rider for this special duty, organising a circuit of trade, the towns in which were visited by him a certain number of times in the year; and lastly, the saddle-horse gave way to the 'trap' and the railway. These seven stages of advance are distinctly traceable in many if not in most of our principal departments of trade, in the relations between the manufacturer, the wholesale dealer, and the agent; until at length the commercial traveller became developed into his present completeness. The large manufacturing firms now employ many travellers each, representing them in various parts of the United Kingdom. Whether conversant or not with the processes of manufacture, these travellers must be well acquainted with the nature and quality of the articles produced, and with all the minute daily fluctuations in the state of the market. They must be trustworthy men, and not unmindful of the usages of social courtesy. Some of them are rather commission agents than salaried travellers, that is, they travel for more houses than one, and depend for their remuneration on the amount of orders they succeed in obtaining. Some, devoting their whole time to one firm, are paid partly in salary and partly in percentage. Some make an agreement with the firm concerning travelling expenses; the firm either refunding exactly the amount expended by the traveller, or else allowing a certain sum which he may lay out as he pleases. Owing to these varieties of system, the average incomes of commercial travellers could with difficulty be guessed at.

The inns at which these energetic men sojourn at night, and for the most part take their meals during the day, are in many ways characteristic. The 'commercial room' is quite an institution of

the times. Some of the inns and hotels depend chiefly on the visitors to this room, deriving much more from them than from coffee-room visitors. In such instances the attendance is prompt and sedulous; the waiters and 'boots' know the hours of every train going in every direction; the viands are good in quality and reasonably well cooked; the beverages must be pretty free from sophistication, or the experienced consumers would soon find it out. As a rule, the room is set apart for 'commercial' only, in the principal establishments selected by the fraternity; but the rule is made elastic, for any stranger who readily falls in with the usages of the place, especially if he brings a conversational tone with him, is usually welcome.

Some few years ago the commercial travellers took exception to one feature connected with inn-life. There may have been changes since then; but at a period when economical French wines were not obtainable in England, mine host expected his commercial guest to drink wine at dinner, generally port or sherry, at the rate of say five shillings a bottle. The charges for bed and dinner were, and still are, lower than those paid by a coffee-room guest, as were usually in some degree those for breakfast, &c.; but while the coffee-room guest was left free to choose in the matter, the commercial-room guest was expected to take and pay for wine. A journal belonging or relating to the fraternity, the *Commercial Travellers' Magazine*, took up this matter as one that called for a little reform; and the daily newspapers discussed it at some length. The line of argument used may be gathered from the following: 'This is not a tectotal question--not whether wines and spirits are to be drunk by commercial men or not. The question is whether the innkeeper, on the one side, must continue bound, as he generally is, by the custom of the road, to provide a good dinner at two shillings each, and the traveller, on the other, to drink a pint of hotel-wine for "the good of the house." Or whether, under the auspices of leading commercial men, co-operating with the proprietors of some leading commercial hotels throughout the United Kingdom, this oppressive system cannot be broken down, and a fair scale of charges be substituted, mutually agreed upon as remunerative for accommodation given and for meals provided.' The innkeeper, under such a suggested improvement, 'would no longer look to make up his loss on meals provided at too low a rate, by the profit he makes out of wine, or balance the loss he may sustain in only charging one shilling for a bed by the gain on spirits, which the traveller by the same custom is expected to drink.'

Sometimes deviations were made from the plan by mutual agreement. A manufacturer who 'travelled' on his own account, said in one of the journals: 'I know travellers who wishing to be free from present customs, and yet wishing fairly to remunerate the innkeeper, always offer to pay an extra price for their dinners, &c.; and there are inns also where the same proposition is advertised by the landlord in the commercial room. This does not, however, meet the general case. Commercial men consider it a point of etiquette that those who sit down to the commercial dinner, provided at one o'clock or half-past, should partake jointly of the wine; and the man who wishes to take beer or water in preference, is not a welcome guest at the table unless he will pay for his share

of the wine put upon the table; and this often leads those who take wine to drink more than the usual pint. From experience I know that the president (there is a rule as to who shall be "president" and "vice" at each dinner, according to the length of their sojourn at the inn) of the day generally orders a pint of wine for each person at the table, whether he be a wine-drinker or not; and thus the abstinence of one or two may tend to the excess of the others.'

Some members of the fraternity have suggested a kind of co-operative plan. Thirty thousand men at a pound a year each could form themselves into a hundred clubs, in as many or half as many commercial towns. This sum would form a groundwork for the landlord or manager to rest upon; and the contributors, visiting the club as a commercial room, would be entitled to frame a tariff in which everything could be properly paid for, but nothing beyond the actual consumption of the guest. Each person could then treat the wine question as he pleased; and it is believed that the one pound would be saved many times over in the course of a year. There would be an opportunity too of grappling with the old anomaly of fees to servants: this is easily grappled with at the London clubs, by simply paying the servants sufficient salaries or wages.

Those who are best acquainted with this walk in life will be able to say whether improvements have lately taken place in these matters. There seems no good reason why commercial men should not adopt the sound commercial principle of only giving value for value received.

The commercial traveller, as a rule, is a sociable fellow; but those among them who are married do not find Sunday the most sociable day of the week, for they are too seldom able to be with their families. It has been suggested that Saturday to Monday tickets by rail, at low fares, would be a boon to many of them, as giving them an opportunity of spending a day with the folks at home. A 'Commercial Travellers' Benevolent Institution' shews that the fraternity is not wanting in kindness towards the less fortunate or superannuated members and their widows; while a 'Commercial Travellers' School' evinces a similar thoughtfulness in regard to orphans. It comes within our personal knowledge that a committee of commercial travellers, with headquarters at Bristol, collected the munificent sum of one thousand pounds towards the restoration of the fine old church of St Mary Redcliff in that city.

CAPRICES OF THE NILE.

THE Nile, as is well known, annually overflows its banks, and deluges a considerable part of Lower Egypt, such overflows giving periodical fertility to the soil. These floodings, however, are by no means uniform in character. Sometimes the floodings are large, sometimes disappointingly small. Nor do they always take place at the same period in the year. Occasionally they are late and tardy in their rising and falling. When the river rises well, it is called 'a good Nile;' when insufficient in volume, it is called 'a bad Nile;' just as we speak of a good and a bad season.

These caprices in the rise of the Nile have appeared to be so mysterious that certain astronomers are inclined to trace some connection between them and the absence or return of solar spots. But on this theory there are differences of opinion. While one astronomer thinks that spots in the sun lead to a heavy rainfall, others just think the reverse. Obviously, the sun-spot theory is somewhat visionary. The rise of the Nile depends on meteorological conditions near the sources of the river in Central Africa, of which we possess but imperfect information. A correspondent of the *Times* (October 31), who, writing from Alexandria, gives a variety of curious particulars regarding the Nile, comes to the conclusion that the solar-spot theory is untenable. He says, that 'so far as can be seen in Egypt, there does not appear to be any periodicity of high Niles agreeing absolutely with the acknowledged periodicity of sun-spots, and the cause or causes of maximum rainfalls must be sought for nearer home.'

A bad Nile followed by the heat and desiccation of an early summer, such as occurred in 1869, is productive of that terrible result, a want of fresh water, either for domestic purposes, or for the lower animals. But that is not all. In consequence of the dryness of the ground in the region adjoining Alexandria, the salt water of the sea percolates inland, and gives a saline quality to the Nile and water-works for a distance of seven miles. The writer whom we have quoted, speaking of the drought of 1869, says: 'At Rosetta the water was unfit for man or beast, the cattle died from it, and vegetation languished; people gave famine prices for a goat's skin of muddy stinking water from such ditches in the country as the sun had not evaporated. There were just the elements for a plague or epidemic. At every low Nile period, the fresh water in Alexandria is bad, more or less; it was so this year; but after a very low Nile it is very bad, and may be the cause of an epidemic some day.'

The Romans, by means of gigantic tanks, of which remains are visible near Alexandria, did much to assuage the evil effects of a low Nile; but in the present day, though Egypt is in various ways advancing in a knowledge of the useful arts, we cannot expect to see anything like a revival of the energy demonstrated in the occupancy by the Romans. The miserably backward condition in almost every country that had the misfortune to fall into the hands of the Turks evokes the most painful emotions. The ingenious writer just referred to sees no prospect of the waters of the Nile being conserved by the present rulers of the country. 'Had such a river,' he says, 'and such a Delta existed in any state of Western Europe or America, the thing would have been done long ago, if not by the state, by private enterprise. Look at Holland. Look at Lincolnshire, where, by private enterprise, seven hundred and fifty thousand acres of salt marsh and swamps and fens, under exactly the same conditions as those marshes of the Delta of Egypt (save wanting the rich Nile-mud to hasten and increase the value of the returns), have been reclaimed, and where an estate which sold for seven thousand pounds before the reclamation works were commenced, sold for fifty-seven thousand pounds after they were completed, and the value of everything was increased by a hundred per cent. The problem of the reclamation of the

marshes of the Delta of Egypt is precisely identical, so far as the means of doing it are concerned, to that of the English fens; the only difference, in fact, being that in Lincolnshire the object is to keep out the tides when they are up, and open the sluices when they are down, in order to let out any rain-water in case of heavy rains when there is too much of it; here you want a bank and sluices to keep out a sea which has scarcely any tides at all, and the sluices to let out into the sea the Nile-water after it has deposited all its mud into the marsh. To reclaim Lake Marcotis by a sea-bank and sluices about half the size of those used in Lincolnshire, and a small canal to let in the muddy Nile-water, or clean out and extend the present ones, and reclaim its two hundred thousand acres, is a very small and simple matter. The harbour-works at Alexandria will soon be finished, and the plant and staff would be at liberty for the sea-bank and sluices—a rare opportunity of doing it cheaply. With the experience of what has been done in the Lincolnshire fens, and canals in India paying 39·7 per cent., 36·6, and 22·72 per cent. of revenue on capital, no one need hesitate to discuss a thing promising such safe results.

We have pleasure in helping to give currency to these serviceable hints from an intelligent observer.

ABSENCE OF WHITE COLOUR IN ANIMALS.

Some very curious physiological facts bearing upon the presence or absence of white colours in the higher animals have lately been adduced by Dr Ogle. It has been found that a coloured or dark pigment in the olfactory region of the nostrils is essential to perfect smell, and this pigment is rarely deficient except when the whole animal is pure white. In these cases the creature is almost without smell or taste. This, Dr Ogle believes, explains the curious case of the pigs in Virginia adduced by Mr Darwin, white pigs being poisoned by a poisonous root which does not affect black pigs. Mr Darwin imputed this to a constitutional difference accompanying the dark colour, which rendered what was poisonous to the white-coloured animals quite innocuous to the black. Dr Ogle however observes, that there is no proof that the black pigs eat the root, and he believes the more probable explanation to be that it is distasteful to them, while the white pigs, being deficient in smell and taste, eat it and are killed. Analogous facts occur in several distinct families. White sheep are killed in the Tarentino by eating *Hypericum criscum*, while black sheep escape; white rhinoceroses are said to perish from eating *Euphorbia candelabrum*; and white horses are said to suffer from poisonous food where coloured ones escape. Now it is very improbable that a constitutional immunity from poisoning by so many distinct plants should in the case of such widely different animals be always correlated with the same difference of colour; but the facts are readily understood if the senses of smell and taste are dependent on the presence of a pigment which is deficient in wholly white animals. The explanation has, however, been carried a step further, by experiments shewing that the absorption of odours by dead matter, such as clothing, is greatly affected by colour, black being the most powerful absorbent, then blue, red, yellow, and lastly white.

We have here a physical cause for the sense-inferiority of totally white animals which may account for their rarity in nature. For few, if any, wild animals are wholly white. The head, the face, or at least the muzzle or the nose, are generally black. The ears and eyes are also often black; and there is reason to believe that dark pigment is essential to good hearing, as it certainly is to perfect vision. We can therefore understand why white cats with blue eyes are so often deaf—a peculiarity we notice more readily than their deficiency of smell or taste.—DR WALLACE. *British Association*, 1876.

HALIDON HILL.

A BORDER BATTLE-FIELD.

A SUN-CLAD slope of living green
Under a cloudless Autumn sky
Say, can it be that this sweet scene,
So bright, so sheltered, so serene,
Once echoed with a battle-cry!

Broad, golden fields of waving corn
Tremble before the wind's soft breath,
While through the air is gaily borne
The reaper's song at early morn
And this was once a field of death!

No sculptured stone nor marble fair
Now marks the spot where warriors bled;
Only kind Spring's returning care,
As though she knew who slumbers there,
Bids her first primrose raise its head.

What though this battle has no place
In Scotland's roll of victories won—
The noblest of her patriot race
Here met their foemen face to face,
And bravely was their duty done.

Stern fate is theirs who, conquering, die;
But his an anguish keener far
Who on the gory field must lie,
And hear the foe's exulting cry:
'Our arms have turned the tide of war!'

Then tenderly let Scotland weep
Over her unrequited brave,
And in her heart their memory keep,
All restfully the while they sleep
In Nature's lone and peaceful grave.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
- 2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.
- 3d. All MSS. should bear the author's full CHRISTIAN name, surname, and address, legibly written.
- 4th. MS. should be written on one side of the leaf only.
- 5th. Poetical offerings should be accompanied by an envelope, stamped and directed.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

CHARLIE.

CHARLIE is our pet dog. He is a handsome specimen of what is usually called a 'King Charles' spaniel, black and tan in colour, sleek, and with beautifully long ears, hanging like a silken drapery over the sides of his head. His dark eyes are brisk and intelligent. And when standing in an inquiring attitude, he is quite a picture. Charlie is two years of age. As near as we can guess, he was born on Christmas Day 1873, and so we have fixed on every returning Christmas as his birthday. Although aristocratic in appearance, Charlie is of humble birth. He was one of a litter reared by a breeder, and his early days were spent in a plain cottage in the suburbs. It was only by advertising for a dog of his kind that we heard of him.

The first interview with a dog which is to be your companion and joy of your life for years, is always memorable. On a certain wintry evening, while we are seated in the drawing-room, the door-bell is rung, and the servant announces that there is a man in the lobby with two dogs for sale. The two little creatures were brought upstairs to be exhibited. They were amazingly like each other. One was called Charlie, and the other Prince. The choice betwixt the two was most difficult. At length, one thing determined the selection. Charlie's nose, as we thought, was a trifle smaller and neater than the nose of Prince, and he was preferred. Five pounds were paid for him, and poor Prince was dismissed. We were sorry for Prince then and afterwards. He never found a purchaser, and died young, the victim of an infantile dog disease.

That was Charlie's start in life. There he was, all at once introduced to a scene such as he had never seen before. All around him were gay mirrors, sofas, and chandeliers. Yet he did not manifest any surprise, and that is a remarkable feature in dogs. They are never surprised at anything, nor do they hang back with any degree of bashfulness. No courtier could have acquitted himself with more propriety or com-

posure on the occasion than this little untutored dog. Being put down on the floor, he in the first place took a general survey, and then sauntered about to gain a knowledge of particulars. Meandering below sofas and chairs, his attention was riveted on a fine engraving of Sir Francis Burrell (a prized gift) in a frame, which leant against the wall previous to its being hung up. Charlie looked long at Sir Francis with his top-boots, and his dog stretched out beside him. Perhaps it was the dog more than the boots that fixed his attention. Anyway, he seemed to feel an interest in the picture, for in his ramble he returned to take a second and a third look. We congratulated ourselves with having got a dog which possessed a taste for the fine arts.

Charlie soon felt himself at home in the establishment. Every one admired and was kind to him. He deserved their love and attention. Nothing could surpass his docility and gentleness. Clever, agile, he jumped on chairs and tables, never discomposing anybody or anything. Brought up with commendable habits, and always amusing, he grew up the pet of the household; and so he has continued. It was a redeeming feature in the stern character of the ancient Romans that they associated in a kindly way with pet dogs. In the Columbaria, outside the walls of Rome, is pointed out an earthen vase containing the ashes of a little dog, described as having been the *DELICATUM* of the household. Charlie is our *DELICATUM*. So funny, so winning, so easily satisfied, so obedient, so companionable! Affording from morning to night so much matter of talk as to what he has been doing, where he has been, whether the weather is suitable for going out, what this or that lady visitor has said about him, and so forth in endless chatter filling up pauses in conversation, he proves useful as an antidote to the kind of dullness which is apt to creep over a small family devoid of bustling youngsters. For these and other reasons, it would be painful to contemplate the possibility of either losing or doing without him. We hope to get through the remainder of life in companionship with Charlie.

It is easy to express such a hope. Dogs are short-lived. Their little span is usually ten to twelve years. All dog-lovers, therefore, have in the course of time to incur successive pangs in parting for ever with their cherished favourites. The fondly attached creatures are gone. Their place is vacant. The accustomed cushion by the fireside, the little bed nightly prepared for them, the comb and brush provided for their morning toilet, the crystal jars of water set about for their use, the coat made to protect them from the wet and cold, know them no more. In going out for a walk without them there is a feeling of desolation. Nature appears dull and out of sorts. Inside as well as outside the dwelling there is a mournful consciousness of an irreparable loss—the loss perhaps felt the more acutely, because meeting with little general sympathy. Can we say there is anything unreasonable in feeling for the loss of a being which has innocently engaged the affections? To a dwelling whence in the course of Providence children have been sadly swept away—possibly never vouchsafed—God has given the dog. It is of imperfect intelligence—a four-footed creature below the dignity and deprived of the hopes of humanity, but it has sensibilities and attachments much beyond what are manifested in the lower animals, and, properly treated, is the willing assistant, the friend, we might almost say the worshipper of man. Viewed in the light of a gift to compensate to some extent for what is withheld or taken away, it may agreeably fill up a void, and in doing so realise a truly beneficent design in Nature. So strong is the attachment formed for his master or mistress that in their removal by death, the dog will try still to be with them. He will follow them in despairing agony to the grave—or to the scaffold. At that foul midnight murder of the Duc d'Enghien by order of Bonaparte in the fosse of Vincennes, his little dog laid itself down disconsolately to perish on his grave. At that dreadful execution of Mary Queen of Scots, in the castle of Fotheringay, a little pet dog which had followed her unobserved was found nestling in the garments of its beloved and grievously outraged mistress.

We have not in our day been unacquainted with the feelings which are apt to be experienced in the loss of a favourite dog. Twice have we gone through the distressing ordeal, and twice did we form a resolve not to suffer the like again. The blank, however, was so great, that like others in similar circumstances, the rash resolve was departed from. Let us say a few words regarding the two pet dogs who were the predecessors of Charlie.

Our first dog was Fiddy, a lively little spaniel of the black and tan variety, but not quite pure in breed, for she had a few white hairs on the breast, and I am inclined to think she had in her a dash of the cocker; for she had a capital nose, and at all proper opportunities while in the country she was on the outlook for game, her tail all the time going at a great rate. Fiddy was born in

1847. Her father, named Tom, and her mother, called Beauty, belonged to a lady of our acquaintance, who generously made a present of pups to all who would accept of them. Such she did for years. A peculiarity attended the progeny of Tom and Beauty. The longer they lived their pups fell off from the black and tan variety, till they degenerated into party-coloured animals—always charming little dogs, but evidently partaking of the quality of some far-off mottled original.

Fiddy possessed a good deal of character. Gentle, affectionate, and docile, she yet in the way of walks and runs liked to have a little of her own way. She did not approve of always going in one direction, but preferred variety, so as to make fresh investigations among bushes. Her diverting ways led to the idea of writing her autobiography, which I prepared, nominally as editor, in a small volume, as a specimen of fanciful typography for the International Exhibition in Hyde Park in 1851. It was styled *Fiddy, an Autobiography, edited by her Master*. Only a very few copies were printed for private circulation, and as I know of only two copies being in existence, it must be considered to be about the rarest book in Her Majesty's dominions.

One or two short extracts from the autobiography to give a notion of the thing: Fiddy being taken on a visit to a small country town on the banks of the Tweed, writes as follows: 'Here there was only one dog with which I occasionally had a run on the green. He was called Dandy, and lived within a neighbourly distance. Dandy was a Scotch terrier, with an astonishingly long body and short legs. He had a large head, and if not wise, he had at least a look of great gravity. Dandy could not run very fast, and I always outstripped him in a race. But he was good-humoured, and never was angry when I teased him. One day when Dandy called on me, we had a conversation respecting the different ways in which dogs live. He distressed me very much by saying that at night he thought himself well-off when he got the mat at the room-door to lie upon. He seemed to envy me when I mentioned that I was provided with a regular bed, fitted up in a basket for my use, and also, that every attention was daily paid to my toilet. Until this moment, he had no conception of such refinements. . . . Dandy possessed strange notions of independence. When his master was absent from home for a few days, he went off composedly on jaunts on his own account. In this way he visited a number of farm-houses within a circuit of four or five miles, where he was well known and hospitably entertained, and renewed his acquaintance with the collies and terriers of the different establishments.

Returning to town, I was destined to pine. Master and mistress departed on a journey to a far-distant place, and were absent a long time. They went away at the end of March 1849. On the day before their departure, I suspected what was about to occur. I saw much packing of portmanteaus and

carpet-bags. I could only look on in silent regret, and pensively wag my tail. Nothing could amuse me. It was in vain I was told "there was a cat in the garden." If there was one, which I doubt, I had not the heart to run after it. I accompanied master and mistress to the railway station. I licked their hands, and would have remained with them in the carriage, if my female attendant, Christy, had not carried me away. When the train was gone, I was in despair. A Victoria biscuit could not console me. To relieve my feelings during the absence of my benefactors, I kept a journal, from which I select a few passages.

Cannot describe Christy's solicitude about my happiness. She is constantly trying to amuse me. Every fine day I am taken out for a walk. To-day, I was taken to see a steam-boat. Did not like the deck: too many people. Much pleased with the cabins; because I could easily jump into and out of the boats, which are almost level with the floor. At a baker's shop Christy bought for me a thin cake of gingerbread, which a boy took from me while I was carrying it in my mouth. Don't like boys, and neither do I like dogs, for they often take my biscuits. Have just heard that master and mistress are in Paris, and will not be home till nearly the end of May. Do they ever think of me? Can they be aware of my anxiety for their return? I know I am only a little doggie; yet have I not been endowed with feelings of attachment to my benefactors, and do I not give up all for their society? When, when will my kind friends come back, and relieve the aching heart of their faithful Fiddy? *May 23—Evening*—I am delicious with joy. They have come home. How happy has been our meeting! I licked over their hands and face. And they did not forget their poor little doggie when hundreds of miles away! They have brought me two sweet biscuits from Paris; and as a souvenir have presented me with a china-cup out of which to take my milk in the morning! Kind master and mistress, Fiddy will know how to be grateful!

For a number of years Fiddy was our solace, our DELICUM. Never having been addressed rudely, and having experienced no injury or neglect, but having, on the contrary, been uniformly treated with kindness, and a proper regard to her feelings and habits, she was unconscious of any fear of injury. Like a happy and light-hearted child, ignorant of sorrow, she was usually playful and amusing, with the additional recommendation of being free from the pettishness of over-indulged children. Many persons have some oddity of manner confirmed into habit. Some men, when puzzled, scratch their heads; others, when pleased, rub their hands. Fiddy had an eccentricity of this kind. When excited by any pleasing emotion, such as the prospect of going out, she scratched her shoulder with her right fore-leg. That leg at length gave us some concern. Having gone through a small stream when heated with running, she became afflicted with rheumatism, and at times held up the leg in a state of pitiably agony. On these occasions a jug of hot water being procured, she stood with the leg in it till the pain had vanished, and her playfulness was resumed.

Unassuming and unaffected, her perfect simplicity of character excited our admiration. Fiddy was a study. Well off, as may be said,

in her circumstances, she gave herself no airs, never was the least uplifted. Treated as a companion, she furnished constant interest and amusement. To old acquaintances she ever gave the same kindly greetings—welcomed all alike; demonstrating her affection only in a higher degree to those who paid her marked attention. To our grief, she began to fail in 1856. She walked feebly about the grounds outside the house, and could no longer take distant excursions. On her birthday in July 1858, she was decorated for the last time with her silver bell and her medal—a gold dollar which I had brought with me on purpose from the United States. Her breathing was very bad. She panted dreadfully. Much of her time was spent in sleep. Her last days were at hand. Our dear Fiddy died peacefully in the arms of a young lady, when about to remove from the country to the town in October 1858. She lies buried on a sunny green knoll overlooking the Tweed, where flowers blossom and birds sing every returning summer over her tiny grave.

Stunned with the loss, we were without a dog for several years. At last, overcoming sorrowful recollections, we ventured upon another. This second one, Fanny, was also a King Charles, but a degree smaller than Fiddy. We got it when it was very young in 1864.

Fanny grew up a charming toy-dog, and in her turn was the DELICUM of the household. In her winning gentleness and affection were repeated the amiable qualities of her predecessor. In some of her habits she was not so *pronounced*, yet was in no respect less a general favourite. From the tranquillity of her manner we were enabled to secure some good photographs of her in different attitudes. Circumstances induced us to take her on several excursions to distant places, and she never gave any trouble. In the railway trains, she couched by my side for hundreds of miles without stirring, and scarcely was any one aware of her presence. I have pleasant recollections of her rambles with me under the trees of the Mall in St James's Park, where Charles II. used to stroll about with his pet dogs,—of her merry gambols on the yellow shingly beach at Ventnor in the Isle of Wight,—and of observing with interest her nasal scrutiny of the massive blocks of Stonehenge. She had not the robust constitution of Fiddy, but she might have lived equally long, had she not been injured by a kick which a brutal wretch gave her one day in the street. She never fully got the better of this unprovoked assault. Weakened in her powers of locomotion, she finally was unable to walk, and died prematurely in June 1873, every one in the house lamenting her decease. She lies buried on the flowery bank along with Fiddy.

This sorrowful event brings us to our acquisition of Charlie, the present dog-incumbent of the dwelling, and inheritor of the trinkets and trappings to which he has naturally succeeded. It would be difficult to speak too flatteringly of Charlie. Sprightly, with an inexhaustible fund of good temper, he is never, even when a little provoked, been known to snap, or appear surly. Vigilant as a watch-dog, he barks at any unusual ringing of the bell at night or noise outside. While in town, his favourite seat is on a small table at the parlour-window, to observe what is going on in the street. When taken to the country, he bounds like a mad thing among the trees,

and is ever ready for a ramble. One of his eccentricities is the vanity of shewing his tail. On being fondled, he turns and twists, bringing his tail forward for general admiration. In such cases he does not mind being laughed at when placed on a table to go through his amusing pantomime. Another eccentricity consists in rolling over delightedly on any morsel of biscuit given to him. Tossing it up, he rolls over and over upon it in the height of enjoyment, affording an instance of how little will give pleasure. Visitors declare that Charlie is the funniest little dog they ever saw. Matchless for his attractive beauty, he does credit to the breed, of which he is acknowledged to be a fine specimen. Though speaking from a limited experience, I venture to think that for a quiet dwelling no toy-dogs can excel the King Charles variety, provided they are properly trained and cared for, according to the delicacy of their constitution. The breed has latterly become scarce, and pugs are now all the fashion; but from this new taste there can scarcely fail to be a rebound to the beautifully formed and gentle kind of dogs described in the present sketch.

The pleasure and advantage of keeping a dog of any variety must of course depend on the way it is bred up and treated. It is impossible to speak too severely of the manner in which dogs are often neglected, misused, and allowed to roam about to the annoyance and danger of neighbours. The dog, like every domesticated animal, has rights to be respected, and this should be kept in remembrance, if nothing else is. The toy-dog in particular, with its keen sensibilities, pines under neglect, and will die from misusage. Thoughtless or hard is the heart of those who forget their duty to the little creature, which on its part never fails to shew its love and fidelity by all the means in its power.

Happily, the greater number of persons we have known as keepers of toy-dogs have not erred on the score of neglect, and they have been rewarded accordingly. Their pets within the limits of their capacity have helped to assuage lingering sorrows, and like gleams of sunshine have cheered many a lonesome dwelling. Therein lies the philosophy of the question. Less or more all minor and companionable domesticated animals may be deemed assuagements sent to lighten the burden of cares or misfortunes, or at the very least to meliorate solitude. A contemplation of the grander works of Nature, magnificent scenery, the rich garniture of fields and gardens, the higher flights of genius exerted in pictorial delineation, the welling springs of literature, are all inspiring, and in their way soothing and consoling. But the cravings of the desolate are for what is inspired with life, for in living and familiar forms we are fain to possess objects on which, for lack of something better, the finer affections may be drawn out and expanded. The cat purring in tranquil enjoyment beside the poor widow knitting at her solitary fireside—the small bird gleefully chirruping in its cage in the sunshine, reminding orphan girls of what had given pleasure to a deceased parent—the droll, or it may be pathetic, words repeated by a starling in the confined apartment of an artisan suffering from domestic bereavement—may they not be accepted as something to soothe asperities that are felt to be almost insupportable? Viewed in this light, pet animals

are subjects of interesting reflection. They are, in a sense, the auxiliaries of religion and philosophy.

The small domesticated dog, from its singularly companionable qualities, is beyond all inferior creatures to be appreciated. In its very simplicity and gentleness there is a reflex action to induce in us kindly views, as well as a calm contentment with our condition. In little Charlie we have a daily monitor in the ordinary concerns of life, obliterating cares, and reminding us how much there is to be thankful for in blessings that are apt to be passed over with indifference.

W. G.

THE ARAB WIFE.

A TALE OF THE POLYNESIAN SEAS.

CHAPTER XII.—WANDERING.

My chief concern was with Bikur. His state of mind was evidently deplorable. Between his fear of me and his dread of the adventure, he was fast approaching a condition of absolute desperation. I consulted Fatima; and that admirable woman proposed that by taking hold of his superstition we could turn it to our advantage, as now it was to our weakness. She advised that I should go through some mumbo-jumbo performance, and give to Yarifa and Bikur a pebble or trifle of some kind as a fetich, which would protect them from all assaults of magic night, unless made by a wizard with more powerful spells than I possessed. Accordingly we set ourselves to work to devise some plan by which I might overawe Bikur into placid obedience by working upon his imagination, and then raise him to the height of bliss by the pretended talisman. I rummaged over the desk of the Dutch captain for papers that might give me a hint, and I perceived for the first time that there was a set of drawers secreted under the compartment for paper. I ferreted about the compartment with my fingers, and at length convinced myself that the spring was on the outside; which proved to be the case. Touching one of the ornaments, the head of a long shallow drawer became manifest; and this I drew out with much eagerness. It contained nothing at the first glance; but a more careful survey shewed a little piece of paper rolled up and tucked under the velvet which had been loosed. I for the purpose. I unrolled it, and saw in Greek characters *ανανκη*. Fatima ejaculated 'The word, the word!' and rushed for the casket; but as she could not read Greek she had to let her lord accomplish the task. I carefully arranged on the casket the letters *ανανκη*. But to my disappointment the lid remained fast. Then I tried it according to the pronunciation, *anankē*; nothing budged. Sure that it was the word, I tried it again as I thought it would be pronounced by the Dutch, *amankie*, and the lid of the casket opened instantly.

It disclosed a necklace of rubies so magnificent that I thought at first I must be dreaming, as large rubies are quite rare. Yet here were twenty-three stones, each of them of quite unusual size, and in the centre was an opal of the most dazzling lustre as large as a good-sized walnut. I threw it with irrepressible enthusiasm around the snowy neck of my darling wife, who received it with becoming modesty. We both resolved to look upon it as a favourable omen. Taking the casket

to the cabin and hiding it away with its precious contents, Fatima returned with a lightsome countenance. 'Husband,' said she, 'I see the way to pacify Bikur and Yarifa, and secure them in perfect obedience. You told me that from what you had seen in an almanac on board the Dutch vessel, there will shortly be an eclipse of the moon. Let us land if possible, and do you draw a circle on the ground and utter conjurations. Then as the shadow steals over the moon, produce the casket, and place it in the circle, speaking in Arabic, and ordering the enchanter who by his spells is darkening the bright circle of the moon, to command me to give the magic word.'

I thought this an excellent device. So far as my memory served me, the eclipse ought to take place some time about midnight of the following day, so I took the first opportunity of calling Bikur on one side. (Giving the wheel to my wife, I went forward with him, under pretence of shifting the foresheet, and said: 'Bikur, the decisive moment will soon arrive; and I feel that I cannot blame you for being afraid, because you have no talisman to protect you from afrits.'

'Ah, suh!h, that is so. If I had a talisman like my lord's, I would not care for Sheitan, or for an army of ghouls and afrits; Bikur is a brave man; but what could he do against spirits!'

'That is true, Bikur; and I am now going to give you a talisman more potent than the seal of Solomon. You see this golden ashrafi. I give this to you freely, and know from this moment that nothing above ground, under ground, in the air, or in the water, can harm you.'

Bikur's gratitude was unbounded; and he immediately passed a string through the sacred coin, and hung it round his neck. 'Now Bikur, you are safe, but the moment approaches. To-morrow night most likely you will see an extraordinary phenomenon; but you have a potent talisman, and you must not fail me on that occasion, or I cannot guarantee your life.'

'What must I do?' said Bikur in a not very courageous tone.

'You must stand with a drawn sword on my right hand, and Yarifa must stand behind us, holding up this charm,' shewing him a quadrant. 'If you run away, all is lost.'

Bikur went away with a very cheerless countenance to share his troubles with Yarifa; but on the whole his aspect was more cheerful, and he evidently put the strongest confidence in the talismanic piece of gold.

As day broke on the following morning, we opened a little bay so beautiful, it seemed like a picture from a fairy tale. The water was perfectly clear, and the sandy bottom, strewn with shells and coral, was so distinct that I expected the pirogue would ground every moment. But there was no danger, for near as it seemed it was fully twenty feet down. Fish of the most brilliant colours were darting about, and at the head of the little bay was a bank of soft green turf. Beyond that was another much higher bank, on the top of which tall trees were growing. Here we landed; and climbing the second bank with some difficulty, as it was pretty steep, Bikur and I found ourselves at the entrance of a thick forest. There were hosts of monkeys and parrots among the trees. We threw ourselves down under some trees that had a fruit so much resembling the guava, that I plucked

some and commenced eating without scruple. If they were guavas they were twice the size of any I ever saw in India. As I sat enjoying the luscious fruit and revelling in the strangeness of the situation, I could not but feel touched by the thought of what my darling Fatima was undergoing for my sake. Not by a look nor by a gesture, far less a word, did she ever complain of any hardships, or give me cause to remember how much she had sacrificed for me.

I rose up, flushed with the determination that come what might I would never cease to be to Fatima as fond as I was then—that I would never cease to be the lover as well as the husband. The underbrush was not enough to impede our progress, and we tramped through for about a quarter of a mile, which was as far as I dared go for fear of losing myself. On our way back, Bikur spied an opening in the wood, and making for it, we found one of those natural glades which so puzzle philosophers. When I come to think of it, it is strange that there should be a spot where trees will not grow, although the seeds of hundreds of kinds must be blown there. Such places serve as breathing-holes to the forests, I should think.

At one end of the glade three deer were feeding peacefully, and I resolved to have two if I could. They were small, and speckled with white beads like Ceylon deer. I had taken the precaution to bring a musket with me, and after seeing that it was in good order, I took a deliberate aim at the fattest, and fired, bringing it down. Then, what a commotion took place in the trees! Birds of every description rose in clouds in the air, monkeys shrieked and chattered, and lizards rustled down the brown trunks. The whole place swarmed with awakened life. The deer remained where they were, and I secured another one with the same ease. Then carrying one on my shoulders, followed by Bikur with the other, I paddled back to the pirogue.

When the hour approached for the incantation scene we all paddled ashore in the sampan. I handed the quadrant to Yarifa, who received it with a shudder, and Bikur snatched up his sword with an air of desperation. Giving the casket to Fatima to carry, with the word formed *all but one letter*, and having my gun on my shoulder, we started for the glade. On arriving there I measured off a circle, and levelled the long grass so that the casket when placed in the centre could be plainly seen. As nearly as I could judge, the time of the eclipse was at hand; so taking my place in the circle, I ordered them to get in their places, and we remained motionless till a black shadow began to eat into the bright disc of the moon. I chanted some doggerel verse, and the black shadow grew larger and larger, until the whole was obscured. It was now nearly pitch-dark, and I called in English, 'The word, the word, the word!' Whereupon, while Fatima solemnly emphasised the word *an-an-kie*, I stooped, and picking up the casket, touched the remaining letter, which threw open the lid of the mysterious case. The effect was what I anticipated; Bikur and Yarifa both sunk to the ground in a half-swoon; and it was not until the moon had resumed her brightness that I could restore them to reason.

'O Allah, Allah!' cried poor Bikur; 'is it over?'

'Yes; thanks be to Allah,' I replied. 'It is over, and the casket is open.'

They looked, and saw the opened lid, and burst into a rhapsody of delight.

'I was not afraid; was I, my lord?' said Yarifa.

'No; that you were not,' said I heartily. 'And I am sure that Nizam will reward you both well; and so will I.'

'Shall we go back now to Gezireh?'

'Perhaps, my friends.'

Whereupon the poor deceived creatures kissed my hands rapturously, and were transported with pleasure. We returned in the best humour to the pirogue, and hoisting sail, steered straight for Gezireh. But as soon as Bikur was fast asleep, my wife came to my assistance, and we veered round and stood once more for the south. At length I heard Bikur pointing out to Yarifa, with the air of one who has made a great discovery: 'See, black woman; now we return to Gezireh, the land is on this side; but when we were going to the magician's land, it was on that side.'

'That 's so,' said Yarifa. 'You're a clever man, Bikur.'

'I am indeed; and we may be proud that we were selected for this great enterprise, for no one could have done it but us.'

Still southward and still southward we crept, the wind seemingly chained to our sails. I had heard of this extraordinary quiet weather among these islands and around Polynesia, and yet it seemed incredible. But at length the sails flapped idly to the masts, and we were becalmed.

'Ugh, ugh!' cried Bikur; 'not far from Gezireh now; I know it by the calms.'

But there is a southern latitude of calms as well as a northern, and this I explained to Fatima; we were approaching the termination of our voyage, though no wind, not even a sigh of wind, disturbed the dreadful monotony of the sea. The sun rose and sunk every day on a waveless ocean, and we drifted with the current steadily southward. I pointed out to Bikur how we were drifting, and he looked melancholy for a moment, but soon consoled himself with the idea that he was on his way home.

THE INDIAN COBRA.

DR FAYRER, late Professor of Surgery in the Calcutta Medical College, in his splendid and valuable work *The Theriopathia of India*, says that the annual mortality from snake-bites in that country is 'perfectly appalling,' and gives statistics which, although very incomplete, too well confirm the assertion. Inquiries on this subject were first instituted by Sir H. Bartle Frere, when Commissioner of Sind, and have since been prosecuted by others; latterly very much at the instigation and through the personal exertions of Dr Fayrer himself, who has also long and earnestly studied the natural history of the serpents of India, and all the questions of physiological and medical interest relating to the bites of the venomous species, not only with scientific and professional ardour, but also with the philanthropic object of discovering means by which human lives might be saved.

In January 1870 Dr Fayrer addressed a letter to the secretaries or political agents of the principal governments of India, soliciting information as to loss of life by snake-bites. Replies were received

containing reports from many districts of these governments, of the number of deaths from this cause in 1869; but from others no return was made, so that the information obtained was very incomplete. In forty-eight districts of Bengal, 6219 deaths were reported as having taken place; and in other parts the losses amounted to 5197: making a total of 11,416 fatal accidents of this kind. But it is to be observed that from a large part of India the doctor neither applied for nor received information, and that even from the governments to which his circular was sent the returns received were very incomplete, the area represented by them being less than half of the peninsula of Hindustan; besides which there is reason to think that even in the districts from which returns were obtained, many cases of death by snake-bite must have occurred besides those which were reported, such an accident being too ordinary an event to attract much attention; and Dr Fayrer does not hesitate to express his belief that if full information could be obtained from the whole of Hindustan, 'it would be found that more than 20,000 persons die annually from snake-bite.'

We have been favoured with the following details concerning one of the deadliest of the Indian snakes, the Cobra, by a gentleman who has passed many years in the East. He says: The Cobra da Capello (*Naja tripudians*), sometimes called the *Hooded* or *Spectacle Snake*, is the commonest and at the same time the most dreaded of all the venomous snakes of India. When excited or confronting an enemy, it assumes a remarkably graceful posture of defence, by raising the fore-part of the body to a height of perhaps a foot and a half from the ground, and at the same moment drawing together into a coil the remaining portion of its body and tail, till it forms as it were a kind of spiral spring, which aided by the elasticity and muscular power of its frame, enables it, so soon as it deems its opponent to be within range of its stroke, to launch itself forward with lightning rapidity. In an instant the bite is given, which, as we shall presently see, is nearly if not always fatal.

I believe that the cobra da capello is found throughout Hindustan, though it is far more numerous in some localities than in others. In some of our Bengal stations where I have been quartered, I have not seen a single cobra nor noticed the trace of one from one year's end to the other; in others, especially during 'the rains,' hardly a week has passed without several having been seen.

In Bandelkum, especially in the neighbourhood of Jhansi and Lallupore, the cobra is unusually common. It harbours chiefly in holes under the foundations and in the walls of old ruined forts and temples, in honey-combed ant-hills, in the sides of old wells, or amid the debris of fallen buildings and deserted outhouses, particularly where grass and jungle have been allowed to grow, and rubbish to accumulate. During the day it is rarely seen abroad, but lies coiled up asleep in its place of concealment, sallying forth in search of food so soon as darkness sets in. It preys chiefly on frogs, toads, rats, young birds, and the like. It will readily invade a house in quest of such creatures, and on entering a room travels round the angle made by the walls and

floor. During the hot-weather months, when, on account of the oppressive heat, doors and windows are left wide open throughout the night, and there is nothing to bar the entrance of vermin of all sorts, it is nothing unusual in the morning to find portions of the slough cast off its body, by a prowling cobra. Houses with thick thatched roofs, particularly old buildings, are always more frequented by snakes than tiled dwellings of recent construction.

It is a mistake to imagine that the cobra, or in fact any other kind of serpent that I am acquainted with, will ever bite or molest human beings, unless disturbed, meddled with, or provoked in the first instance. On the contrary, the greater majority of snakes are only too glad to be permitted to escape and beat a retreat when discovered by man; and unless driven into a corner or followed up, speedily vanish into some old rat-hole or other hiding-place, without shewing, beyond a threatening hiss, a sign of opposition to, or desire of retaliating on the intruder. I believe that nearly always it is the sense of fear more than anything else that induces the cobra, when surprised or touched even without being hurt, instantaneously to turn and bite the person who has alarmed it. The boots and trousers or leather gaiters usually worn by Europeans when out walking or shooting, in a great measure protect the wearers from the teeth of snakes.

Natives of India, on the other hand, in spite of the fearful loss of life annually occasioned among them by poisonous snakes, appear to be perfectly callous and indifferent about guarding against such dangerous creatures, neglecting to take even the most ordinary precautions. Some classes sleep upon *charpays* or native bedsteads; but the great majority, especially of the poorer orders, sleep on the ground with their heads wrapped up, and their bodies enveloped in a sheet or blanket. A cobra, when travelling at night in search of food, instead of circling round, often crosses over the body or legs of a sleeper; the weight and movement of the reptile partially awaken the unfortunate slumberer, who, in a half-conscious state, puts out his hand to discover what has disturbed him, probably touches the hideous intruder, and is immediately bitten.

When I was quartered at Jhansi in 1872, a poor boy in my service, while lying asleep in the veranda of my house, was fatally bitten by a cobra. It was early in September, one of the most unhealthy and trying months in the year, when to exist it becomes absolutely necessary to keep punkahs unceasingly moving at full swing night and day. I employed three punkah coolies, two men and a boy, who, by taking it turn about at intervals of two or three hours, were expected to keep the long fan suspended from the ceiling, in perpetual motion over my head. Two of these punkah coolies were father and son; the latter, a lad of fourteen or fifteen, often accompanied me in my shooting expeditions, and was rather a favourite. One evening, after tossing about for some time, I managed at length to fall into a doze, and must have slumbered for some hours, when I was startled in my sleep by hearing some one in the stillness of the night suddenly cry out. I was soon asleep again, but was aroused about daylight by my bearer carrying a lantern, who, in an excited tone of voice, informed me that one of the servants

was very ill, and desired me to come and see him immediately. Hastily donning a pair of slippers, I followed my attendant down some steps, round a corner of the house, till presently we reached the veranda facing the south. A group of natives were stooping over and supporting the head of the poor punkah coolie lad, who was insensible; and to my horror, on raising his hand, although it was still warm, I could feel no beat of pulse at the wrist. There were two dark punctures from which the blood was still oozing; and then it suddenly struck me that a snake had bitten him. No time was lost in procuring a bedstead and four bearers, and despatching the sufferer to the hospital, only a few hundred yards distant. But it was all too late; for on reaching the building, the native doctor in attendance pronounced the unfortunate fellow to be quite dead. Probably the reptile had attempted to cross over the prostrate form of the sleeper, and on being touched, had immediately retaliated by biting him.

Determined to discover the hiding-place of the snake, we removed from the veranda a large folded tent and numerous boxes and cases; and nothing remained but two packing-cases, with a small bell-tent rolled up and resting on the top of them. Two men had partially lifted the canvas, when an exclamation from one of them drew my attention to the spot, and on looking round I saw a snake coiled up on the lid of the box from which the tent had just been raised; almost beyond a doubt the one that had caused the death of my poor servant. It was a cobra of moderate size and very dark colour. The creature began to glide away, so I looked round for something to strike a blow with, and on a table close at hand was the very thing I required; what we in India call a *fly-flapper*, a stout cane some two and a half feet in length, with a piece of pliable leather fastened to one end of it. Just as I got hold of the leather end of this weapon, a red setter of mine, named Dash, who had been attentively watching the operation of removing the tent and boxes—doubtless hoping that a rat or some such animal would bolt out from behind them and afford a 'chivy'—caught sight of the cobra, now rapidly stealing off; and with hair bristling erect sprang forward, barking furiously. Instantly the cobra drew itself together, with a threatening hiss, elevated its head and neck, and with flashing eyes and quivering forked tongue, prepared to defend itself; but my dog was too knowing to close with such a formidable adversary, and only kept it at bay till his master came to his assistance and despatched it.

A fruitful cause of fatal accidents among natives by snake-bites may be attributed to their careless habit of walking barefooted when travelling, or when passing through the jungle. Some classes wear low shoes, which, however, seldom reach above the ankle, and though guarding the feet of the wearer to a certain extent, yet afford no protection whatever to the leg, which is almost invariably left bare up to the knee. The consequence is—especially during the rainy season, when vegetation springs up over the whole country with extraordinary rapidity and when all kinds of snakes are on the move—that numbers of unfortunate natives, travelling on the public roads by night as is their wont in order to avoid the heat of the sun, or passing through the grass by day, are fatally bitten, without having caught

a glimpse of the deadly creature which they have inadvertently crushed under foot or brushed against in passing.

Besides the cobra there are other snakes, such as the krait, Russell's viper, the *Ophiophagus elaps*, &c., the bite of which is certainly fatal if the strongest remedies are not instantly applied; hence it is that the government reports as to the exact species that has caused a death, are so frequently 'uncertain.' The victim is bitten, the snake disappears before the victim has had time to identify it, and the mischief is done.

Our Indian cantonments are constantly visited by roving gangs of snake-catchers or, as they are more generally termed, snake-charmers. These wandering bands—generally consisting of three or four individuals belonging to the lowest caste—gain a livelihood by travelling about the country from station to station, and exhibiting to the residents for a small gratuity numerous reptiles, chiefly snakes, which they carry about in baskets. That these people are veritable snake-catchers, I readily admit; for undoubtedly, from familiarity with the habits and resorts of various descriptions of snakes and constant practice in their vocation, they succeed in capturing numerous cobras, rock-snakes, and other serpents both large and small; but whether they are entitled to be called snake-charmers, or in other words, whether, by means of certain musical sounds, they have the power of enticing the wild snakes of the jungle out of their holes and hiding-places, so as to admit of their being captured, is another thing altogether. Natives of the country—who are in general an exceedingly superstitious race—declare these people to be gifted with mysterious and almost supernatural powers over snakes. I have myself, however, no faith in snake-charmers, for I have repeatedly detected them attempting by subtle impositions and clever acting, to delude lookers-on into the belief that they were dealing with veritable wild snakes, when all the time the dancing cobras that made their appearance at the sound of the pipe were some of their own tame snakes, placed in certain spots beforehand.

These professional snake-catchers are many of them, in addition to their regular vocation, most expert jugglers, and exceedingly adroit at all kinds of sleight-of-hand tricks. It is their constant practice to 'turn down' a few tame snakes in a garden-hedge or somewhere close in the vicinity of a house they intend paying a visit to, ere they present themselves before the sahib, the owner of the premises; and then, with every appearance of good faith, the rascals request permission to be allowed to clear the compound of snakes; at the same time stipulating for a reward, perhaps one rupee a head for every snake they may succeed in catching. If the gentleman of the house should happen to be a *griffin*, or new-comer, likely enough he will be induced to lend an ear to so plausible a request, and at length promise these crafty rogues so much for each snake they succeed in catching. Soon, to his horror and amazement, hideous serpents of various dimensions are produced, one from the straw in an empty stall in the stables, another from the garden-hedge, and so on; till at last, perhaps the fraud is carried too far and discovered; but I have known such deceptions successfully practised upon the unwary, and the snake-charmers liberally rewarded for simply

inducing, by musical sounds, some of their own pets to shew themselves and be recaptured.

It is right, however, here to say that certain descriptions of serpents—chiefly of the genus *Naja*, I believe, though I am not positive on this point—most undoubtedly are susceptible to, and in a measure become fascinated on hearing musical sounds. I have constantly seen tame snakes in the possession of snake-catchers, on hearing the sound of the pipe, erect themselves and sway their heads from side to side, and beyond a doubt shew pleasure at the strain; but I have never once seen a wild snake go through the same performance; and I believe that only tame reptiles carried about in baskets and 'broken in' for such an exhibition so conduct themselves. I have repeatedly offered snake-charmers five rupees to bring out from its sanctuary by means of music, a cobra known by me to be 'at home,' but invariably all their efforts have been in vain.

One of the favourite performances of these wandering gangs, especially when there appears to be a likelihood of extracting a larger *baksheesh* than ordinary from the lookers-on, is for one of them to so irritate and provoke a cobra (I need hardly say one that has had its fangs extracted), by pushing his knuckles into the reptile's face, till at length, after several failures, the snake makes good his stroke, and bites its tormentor on the hand, so that blood flows from the wound. Immediately he feigns terror, and produces a peculiar-looking gray substance termed a snake-stone, but which is simply a piece of bone rendered porous by having been calcined; after blowing upon the punctures produced by the serpent's teeth, he places this 'stone' upon the wound, and informs the spectators that by its means the poison will speedily be absorbed, and all danger avoided. There are many who actually believe in the efficacy of these stones; but I venture to say that if such a very simple remedy were really effectual, and a genuine specific, the snake-stone cure would speedily be brought into universal use. It would appear, however, that these people really prize these so-called stones, for I have been present when money has been offered to them to part with one, but declined.

Perhaps the strongest argument against this snake-stone cure, and which I think greatly tends to prove that it is only one of the many deceptions practised on the public by these people, is, that these very men often themselves fall victims to the bite of the cobra, though at the time in possession of a stone which they assert to be capable of working a cure. Moreover, when these professional snake-catchers have to deal with an undoubtedly wild cobra in full vigour—although as a rule they display extraordinary pluck, skill, and resolution in capturing it, and on the first favourable opportunity will with wonderful quickness seize hold of and secure it—an attentive beholder cannot fail to remark the extreme caution and watchful management they display on first clutching hold of the animal; their whole demeanour and action differing unmistakably from the off-hand, careless manner which they assume when grasping one of their own harmless specimens; and it is an undoubted fact that these men really dread the consequences of a chance bite from a wild cobra quite as much as other mortals do, and are well aware that nothing can withdraw

the deadly venom from a wound, or save life, when once the poison has mingled with the blood.

When a deadly venomous snake bites vigorously, the poison which flows through the two fangs is instantaneously introduced into the tissues, thence into the blood, and in an incredibly short time into the whole system. The result is that the nervous system of the victim is paralysed, complete prostration ensues; resulting, in the great majority of cases if not in all, in certain death. The only hope appears to be in the immediate and complete stoppage of the circulation of the blood between the wounded part and the rest of the body, by ligature or by excision or amputation. But the poison enters into the system with great rapidity, and such means, to be of any use, would need to be employed without almost a moment's delay. Ligature, to serve its purpose, must be applied without regard to the pain which it causes, for unless the cord is tightened so as to completely stop the circulation, it will be ineffectual; and an endeavour must then be made to remove the poison completely from the wound, by scarifying the punctures made by the fangs till the blood flows freely, which may be aided by sucking or by cupping. Sucking with the mouth is dangerous to the operator, because the poison may enter his system through the lips or other part of the mouth if the skin is anywhere in the least degree broken. And finally, the actual canterbury is to be used, or a mineral acid or carbolic acid applied to destroy the poison. The natives are accustomed to apply a live-coal or to burn gunpowder on the wound. But even with all the 'remedies' as yet known, including copious doses of brandy and ammonia, and the immediate efforts of skilled surgeons, it is sad to be told by men such as Dr Fayrer and others who have devoted time and energy to the subject, that there is almost no hope of saving life if the bite has been inflicted by one of the most venomous snakes in full health and vigour.

AN OLD MANUSCRIPT.

IN THREE PARTS.—PART II.

June 30.—Mr Salkeld has been ill. His health has always been delicate, and he has overworked himself unsparingly, doing nearly all the duty both Sundays and week-days. Day after day his labours amongst the parishioners have been almost unceasing. The result of this was a fever, caused by a neglected cold. His illness has brought out new qualities in two people: his own patient calmness and resignation in suffering—for he suffered much—and Miss Stanhope's perfection in the sick-room. He came down-stairs to-day for the first time; and my heart ached to see his poor worn face as he sat there in Mr Stanhope's own easy-chair, vacated for him, in spite of all remonstrance, by our good vicar.

July 7.—Mr Arthur Selwyn has come home from college. Effie says her mother is angry with him because he has wasted his time and run into debt. All young gentlemen do it, Effie says. He is not yet Bachelor of Arts. But he does not seem to mind that; at least he is the reverse of sad. And he is very, very good-looking. And such agreeable manners; quite high-bred. He is quite six feet high. Effie says that now we may expect enjoyment to set in. He took us for a long drive

yesterday; all the way to Spindleston Hengh. It was delightful. What rare company he is; so full of life, and so careful of us! Oh, it is sweet to be taken care of. Mr Salkeld never helps one over a stile; but he is good in a different way.

Poor Mr Salkeld! he is still in delicate health. He is going to Scarborough for a time. How we all feel for him! He goes away much against his will, for he says he feels like a sentinel deserting his post. So earnest and true to duty is he.

July 20.—The old Grange is quite another place since Arthur Selwyn came home. There have been several dinner-parties. I was at all. Sarah Cessford came in such a ridiculous dress last night; not in the least becoming. Fancy green ribbons with a pale complexion! She will have fifteen thousand pounds when her aunt dies, it seems. Mr Arthur pays her great attention, which makes Effie so indignant. But I suppose he can please himself as to whom he pays attentions. Every young man does, I believe.

There was a great picnic one day, got up by the Cessfords, and the young Lord Framlington was there—a very girlish young man. Effie and he were together all day, while Mr Arthur Selwyn paired off with Miss Sarah Cessford, leaving me in the hands of Gavin, a most silent gentleman always, but especially so on that day, for he was jealous, yet not interestingly so. 'Lord Framlington is a confounded young milksoy,' said Gavin Cessford. Effie was quite made up with her *viscount*. I should not have thought it of her.

July 24.—I have made a discovery. They say Mrs Selwyn is a Roman Catholic. That is not her religion; it is match-making. Miss Stanhope sees it quite plainly, that she wants her son to marry Miss Sarah Cessford, and her daughter to be Lady Framlington. She is devotedly fond of her son Arthur. I cannot blame her for that; but she will wreck his happiness if she forces him into a mercenary marriage with that Miss Cessford. He is much as told Effie that he rather *dislikes* her than otherwise. If so, then, oh, what hypocrites men can be! She is fat and stumpy, and looks so odd by his six feet of height.

July 29.—I cannot understand Arthur Selwyn. One day he is all sadness and tenderness to Effie and me, and the next quite reckless and gay. Effie says he was never so before. She thinks it is the talked-of marriage that has altered him. She believes he will never have her. But Miss Sarah is hardly ever away from the Grange now. And one day Mr Arthur, when he heard she was there, jumped on horseback and galloped away, and didn't come home to dinner, nor till late at night, Effie said. Effie waited up for him, and he had such a wild look on his face when he came. His mother heard him come in, and came down-stairs; and Effie says there was a scene. But her brother never spoke back in reply to the fierce angry words Mrs Selwyn said to him. And he looked pale, and sad, and miserable.

Effie went to his room an hour afterwards, and found that he had not gone to bed, but was sitting on a chair leaning his head on his hand. She was trying to comfort him, when who should walk in but Mrs Selwyn, who threw herself at Arthur's feet sobbing, and moaning, and kissing his hands, with all her long black hair down upon her shoulders; and she had to be carried away at the last by her husband. Effie said it was quite

dreadful and terrifying. But Arthur sat motionless, like a statue. Miss Stanhope says they are deeply in debt, and that Mrs Selwyn has made up her mind that Mr Arthur shall redeem the last relic of the estate, which was bestowed upon their ancestors by one of the Norman kings. But the struggle between pride and affection is great, and that explains the strange scene which Effie described.

August 5.—Mr Salkeld has returned much better in health. It was quite a relief to me to see his calm happy face again. He commenced parochial work on the very day of his return, and he has let fall words which prove that he has been at work in Scarborough too. There is indeed no rest in these noble natures from the labour of love.

August 12.—Things have changed sadly at Selwyn Orange. A little while ago all was gaiety and sunshine; but now gloom has settled down again. Effie was here one day in sad trouble, and her lovely eyes were quite red with weeping. She says her brother has completely lost all his good spirits, and wanders all day in the woods and fields by himself, or takes long rides. And this on account of the marriage, she is sure. Her mother never swerves on that question. And Arthur himself has never opposed a single objection. But his heart is not in it, Effie says. How dreadful this is.

I could not help crying with Effie for sympathy; and afterwards when we had gone into the garden together, whom should we see come riding past in the lane but Mr Arthur Selwyn and Miss Sarah Cessford! They rode close by and never saw us, so closely were they engaged in conversation. She was looking quite red at something he was saying to her; and he looked all smiling and lover-like. I looked hard at Effie, and she was as pale as death.

'O Arthur! you hypocrite,' she gasped. 'Oh, how can he do it!' and the deep tears welled up in her pure blue eyes. She put her head on my shoulder, and I clasped her in my arms, and again we cried together. I felt very miserable too, more so than I could account for at the time.

Hour after hour I lay awake that night thinking over the sad human scheme that was being laid together by that dreadful dark lady of the Grange; and the more I thought of it the more my heart grew heavy and sore. To think of his whole life's happiness destroyed in that way by his own mother. And he so handsome, and every one so proud of him, and his endearing manly ways. I seemed to look like this far into the future years, and I seemed to see him tied to his plain stupid wife—not a good feature in her face, and her gait—O dear! it was all so dreadful to think of. But what, after all, does it matter to me? Only for dear Effie's sake, of course, for it will almost break her heart. Why does not his father interfere? He looks as cold and unsympathetic as a smiling stone statue. He has no more feeling than the marble effigy of his ancestor, Colonel Prideaux, in the chancel of the church.

I cannot get Mr Salkeld to look on this enormous fault of Mrs Selwyn as I do; he says it is all right enough, and that Miss Cessford is a very worthy young lady. But what has that to do with it? What is worthiness, if he cares no more for her than he does for me, perhaps? Indeed, I think he has quite forgotten me. We have not met for a month, except just distantly on Sundays.

August 20.—I must write to-night, Sunday

evening as it is. They are engaged; Mr Arthur and Miss Cessford, I mean. Effie just found time to whisper it in my ear as we left the church door together, with such a sad, sad look on her sweet face.

And oh! for the hand-shaking that took place in the porch between the two families. And so gracious Mrs Selwyn can be when she chooses. But she only smiles with her lips, shewing her close white teeth; her eyes never smile.

Poor Mr Arthur looks gloomy and resigned. I am glad he did not look cheerful, at all events. I watched him in church, and never a word of the sermon did he hear, I am sure. He looked up only once all the time, and strange to say, he looked straight at our pew, right over the heads of the Cessfords. His eye met mine. I felt my face burning. I was annoyed at being caught; but it served me right for not attending to Mr Salkeld, as I ought to have done. I wonder she does not notice his gloom; but I suppose he will be all smiles to her. *Memo.*—He has his mother's eyes, but so different! Deep and dark as night, like hers; but unlike hers, tender and truthful.

August 29.—I was out walking alone to-day, and whom should I meet but Mr Arthur Selwyn! I met him right in the face coming round a corner, and I looked foolish, if I look as I feel always, for I had been thinking of him all the way up the lane. He was in no way put out, but as pleasant and polite as he, and none better, can be, that ever I knew. I returned his bow rather distantly, and did not offer my hand. I did not know why at the time, nor do I now, except that I could not. I think he saw my reserve, but he shewed no sign, for he talked much as he used to. We walked on slowly side by side for some time, although somehow it seemed a short time. I found that he was not quite so gay in his conversation as usual; just a shade of gravity seemed to have come over him. Amongst other things he talked of his return to Oxford and of a resolution he had made to recover his lost time. 'Fancy!' he said; 'quarter of a century old and still at school!'

But no word passed between us in the least relative to his engagement, which all the people in the country round know of by this time. We parted, as we met, with formal bows. I was going to shake hands with him, but was too late, so we parted ceremoniously. Effie says there is no doubt about his passing all his examinations this time, as he can be deeply clever when he chooses.

September 2.—I am constantly meeting Arthur Selwyn on my walks now; but I am hardly ever alone; either Miss Stanhope or Mr Salkeld is with me; so I have had no more confidential talks; if our talk could be called confidential. He often rides out with his intended, and it seems they are asked out together to evening parties. He is a general favourite, whatever she may be, poor girl!

Sept. 25.—Received a letter from London. They all insist on my going back at once, as I have exceeded my leave of absence. My uncle inclosed a touching letter from little Ned.

Sept. 28.—The result of my London letter has been a family council, with every member of it against my going back at all. If I consult my own wishes, and incline to those who draw me hardest, I fear that I shall never leave this dear

spot, for I have learned to love it and all my friends here very dearly. But I cannot forget that my uncle and aunt have the first claim on me; so back I must go, for that letter the other day was only the most pressing of several that had been sent. The council ended in no settled plan. I had no heart to plead my own cause against them and against myself. I must try each one separately. It is very hard going against the stream, especially when that stream is the current of my own wishes; but my duty is clear if my heart breaks. Mr Salkeld has taught me the divine significance of that word *duty*, and my duty is to conquer selfishness.

Sept. 30.—I have made a compromise. It is settled that I go back to London for the winter. 'Just as if for a visit,' the dear vicar said. I confess that I am a little, just a *little* disappointed. I was wishing they would use strong measures to detain me a little longer. But Mr Salkeld and his compromise settled the matter. Ah me! Effie will miss me, I am afraid. She is violently opposed to my going, and will hear of no compromise. 'Who would be buried in London?' she said. *Mum*.—How sweet it is to be loved like this.

Here my diary ends, and it was never resumed; so the remainder of the story of those sad years of my life must flow from my pen in such fashion as comes soonest to hand. I shall therefore gather together the threads of my narrative from memory chiefly. A few years ago—may one year ago—I could not have written that which I now propose to write, though it had been to save a life. But I feel that I can now look back on the past more calmly, and in a mood more befitting one who has done with the present world as surely as a nun behind her convent walls. I have struggled hard—so hard to attain this more peaceful state of being. I have fought against my erring nature; and in prayer, I have appealed to the Supreme Disposer of all things. I have thus, I say, entered into the season of calm, the final phase of sorrow. But how far from happiness that rest of mind lies is not to be unduly spoken of again in these pages. I will endeavour, therefore, to write as if detailing the scenes, and the feelings of the persons acting in those scenes, as of something apart from myself, with such assumption of fortitude as may be permitted me.

My diary leaves off in the autumn of the year 1814, when, after a happy summer in the north, I returned to London for the winter months. My uncle, aunt, and cousins received me with open arms. They rejoiced; we all rejoiced (for I could not help falling into their joy) like children. Dear little Ned danced round and round me like a young wild Indian, and for a while forgot the beloved subject of rabbits. Poor little man!

It was a winter of almost continual fog and rain, so that I was much indoors; and it seemed to me irksome beyond measure, after the open-air life at the dear old vicarage. But I summoned up all my strength of will to restrain my impatient nature, and to make myself useful to my aunt and among the children; and this discipline did me good. Our Christmas festivities were not very gay, for as I have before mentioned, my uncle was a staunch Nonconformist; and the dear good man held many opinions that I never could think either just or reasonable. Nevertheless we had parties in our

own little set, and enjoyed ourselves in a quiet way. But often and often did my heart carry my thoughts back to dear Northumberland—to the dear little village, and those there that I loved so well—to Selwyn Grange and Effie—dear Effie!

I dreamt one night I saw the Grange by moonlight. I shall never forget the horror of that dream. I saw the old battlements, the mullioned windows, and the cloud of dark ivy which clung to the walls, lying all deep in shadow—dark and sombre as the tomb. Suddenly a great flood of light fell over all the place, and everything stood out clearly and distinctly as under the mid-day sun.

Slow and awful on the hushed air tolled once, twice, the heavy boom of the death-bell—the bell whose tongue I knew; but in my dream the sound of it was weird and oppressive, and I felt upon my bewildered senses a weight of stifling sorrow and suspense; and ever a dark foreboding. Then the hall-door of Selwyn Grange opened slowly and silently, as if by unseen hands, and looking within, into the gloomy old hall where the armour hangs, I saw an open coffin on trestles. Shadowy and indistinct it seemed, and I could not—although my heart-strings almost broke in the effort—make out the face of the occupant. But as I looked, and looked again, I became aware of a dark muffled figure standing by the side of the coffin—standing erect and motionless, but looking down, seemingly, with an intent and mournful gaze. It was the figure of a man; but I could get no sight of his face, which was closely covered with a cloak. Then I also seemed to become aware of a second figure in the presence of the dead: that of a woman, also in deep funeral robes, and with long masses of black hair flowing all around her. A deep sense of impending evil seemed to thrill me like icy stabs at the sight of this woman, and I gasped to utter a word of warning to the tall muffled figure standing opposite, seemingly unconscious of her presence; but in vain, for I could not form one articulate word. My agony was fearful; for I saw the hand of the woman raised aloft as if to strike, and heard a voice exclaim: 'Die, Arthur! last of your race!' Then the blow fell like silver gleam upon the breast of the motionless figure, and again clanged out the deep hollow voice of the bell. At the same instant I awoke to a sense of life, with a wild piercing cry that rang in my ears with the boom of the death-bell, and my whole body writhed and trembled with fierce mental suffering. My aunt rushed into my room, and I clung to her and moaned and implored her not to leave me to myself to sleep out the rest of that dreadful night.

About a fortnight afterwards I received a letter from Effie with the news of the death of her grandfather; and that Arthur, who was at home at the time, had quarrelled with his mother on the very day of the funeral, which took place at midnight by torchlight, at the old church; and that, when urged by Mrs Selwyn to press his suit with Miss Cessford, he had bitterly reproached her with the part she had taken in the matter. But Effie wrote that he still held to the engagement, with a sort of despairing resolution. This, it appears, was the first time that Arthur had expressed in words his dislike to the match; and Effie thought that he would not have done so but that his mother importuned him in the

presence of the dead. Effie chanced to enter the room at the time, and so she witnessed the scene betwixt mother and son—so alike, and yet so unlike!

I need not follow in detail the monotonous round of our daily life at my uncle's house. I tried my very best, and with my whole heart to accommodate my life to theirs and my ways to their ways. But evermore the longing would come for one sight only one, said my traitor heart—of that other home in the far north. This longing grew more and more as the weeks and months of the long winter rolled on, and at times I was miserable; and though I strove hard to conceal it, my relatives began at last to be aware of the change in me. I was filled with grief and shame when my kind aunt gently questioned me on the subject, and I could give no reason for my strange disquietude. I asserted over and over again that I was quite happy, not deceiving myself nor deceiving others. At times I almost hated myself, and tried to force myself into contentment; but all in vain. And equally in vain did I try to analyse the mental state into which I had fallen; I was blind to myself; and irrational morbid fancies began to assail me, and always, ever growing, that craving for what I knew not, except that some phantom hand for ever pointed Northwards. Some irresistible influence seemed to drive the current of my sleeping and waking thoughts in that one direction.

It was agreed by my uncle and aunt that I wanted change. 'Young people cannot be bound down always to routine,' reasoned the dear good folks; and so, as the spring came round, it was understood that I should once more visit Northumberland. Oh, the soothing joys that settled upon my unquiet heart, my rebellious unknowing heart, when this was resolved amongst us!

The time came; and once more I arrived at the dingy inn at Newcastle, and this time Mr Salkeld himself met me with the conveyance, thus making Mark Jervase a bitterly discontented man, he said. And in truth, Mark (with whom I had contrived to strike up quite a friendship) was as sour as vinegar about it. Effie was at the vicarage to receive me with the others; and again I found myself once more under that roof! The dear girl looked sad and ill; and as soon as we were alone she disburdened her heart to me. Lord Framlington had made her an offer, and she had refused him *point-blank*, and another family quarrel had been the consequence. But it was all made up again, she said; for her mother had thrown out a hint about Gavin Cessford and his four thousand a year. That gentleman had, it seemed, become all at once exceedingly shy, thinking probably, that if a lord was not good enough, a country squire would be laughed at; so it had befallen that Effie, the star of beauty of all the north, was left for the time loverless. But *that* was no affliction to her; she was dreadfully uneasy on her brother's account.

'Dear Rose! it is not natural the way he takes it. On the marriage question he is apathy itself. Oh, if I were a man, would I be so driven for all their paltry money!' she said, firing up.

I soon saw that poor Effie's fate in matrimony was a very secondary matter in her mother's eyes compared with that of the adored son; and yet

that son, so dearly loved, she was ruthlessly condemning to a life that must prove to him a living death, from what Effie said. Arthur Selwyn had quitted the university, and was at that time serving in the militia; for all the country was then in arms, and wild rumours were on every tongue about the great dethroned Emperor, who had recently escaped from Elba.

Mr Salkeld and I soon fell into our accustomed groove. Many calm and happy days we passed together at this time; and I gradually found the mad fever of heart and brain, that had so cruelly tortured me in London, yield to his influence and the beneficent labour of the daily work he gently imposed on me. Ah! I was soon to know how delusive was this calm, this hush of feeling, that had been granted me so mercifully. Too soon the angry tide of the turbulent heart disturbed this fair serenity. But at the time I believed myself to be thoroughly happy, except that now and again, when I was with Effie, some look of hers, some motion, or some tone of voice, would pierce my heart like a knife; I knew not why. So much did Mr Salkeld and I seem to understand each other, and so open-hearted seemed our daily intercourse, that the incident which I shall now relate did not come as a surprise; indeed I was in some measure, almost unconsciously, prepared for something of the sort occurring.

GOSSIP ABOUT LIGHTHOUSES.

A STRANGE lonely life must be that of the light-keepers in such a lighthouse as the Eddystone, the Bell-Rock, or the Skerryvore—three men dwelling by themselves in a sea-girt tower, apart from all the rest of mankind, on a rock often entirely covered by the sea, far from the nearest shore, and all communication with it not unfrequently cut off for weeks by stormy weather, which makes landing on the rock impossible; the waves often dashing furiously against the lighthouse, almost to the height of the lantern, and sending their spray far over its highest pinnacle. Many scenes of grandeur and sublimity they must behold, such as even the stoutest-hearted can hardly contemplate without awe; and many scenes also of great beauty, when the sky is clear, and the wide expanse of water is brightened by the sunshine, and the smoke of steamers and white sails of ships give a pleasing variety to the prospect. Yet it seems almost impossible that time should not occasionally hang heavy on their hands, notwithstanding all the resources of the library with which they are supplied, and the duties which they are called on to discharge, among the most important of which are the lighting and extinguishing of the lamps, attending to them whilst lighted, supplying them with oil, cleaning glasses and reflectors, keeping the machinery in proper working order when the light is a revolving one, and ringing a bell or making fog-signals during fogs—duties that involve a great responsibility. Shut out from the rest of the world, any unusual incident must be of peculiar interest to men so situated; and some of the incidents that do occur are in their own nature very interesting.

Some lighthouses are in pleasant situations on the sea-coast, and consist of a tower elevated merely to a height sufficient for properly shewing the light, with the houses and gardens of the light-keepers adjacent to it. Others are in lonely places, far from other habitations of men; on high rocky promontories, where they overlook the waves and are exposed to the utmost violence of winds, and where the voices of sea-birds mingle with that of the ever restless sea; or on wastes of barren sand, where sparsely growing grasses are almost the only vegetation. Some are on islands large enough to afford space for gardens, or even pasture for a cow or two; others on islets so small that their surface exhibits only patches of grass, and it is with difficulty that the light-keepers can cultivate a few vegetables; whilst others still, are on bare rocks often washed by the waves, or on rocks which, together with the base of the lighthouse itself, are covered by the sea at high-water. In the last-named cases, the tower is the only building, the light-keepers dwelling in it when on duty; it is constructed so as to defy the utmost fury of the waves, and is elevated to such a height that in storms they may not dash against its lantern with violence sufficient to injure it.

The force of the waves and the height to which they dash against lighthouse towers in the most exposed situations, are astonishing; and we cannot contemplate them without reflecting how great a triumph of science and art these buildings are, and how strange life in them must be. We find some interesting information on these points in the copious Appendix to the Report of the Royal Commission appointed in 1858 to inquire into the condition and management of lights, buoys, and beacons—a bulky parliamentary blue-book of 1861. At the Longships Lighthouse, on the top of a conical rock opposite Land's End, the Commissioners were told by the head-keeper that in heavy weather, waves break about the lantern seventy-nine feet above high-water mark; and that on one occasion the sea lifted the cowl off the top so as to admit a great deal of water, by which several of the lamps were extinguished, and all the men were employed in baling till the tide fell. He added that there is a cavern under the lighthouse at the end of a long split in the rock, and when there is a heavy sea the noise produced by the escape of pent-up air from the cavern is so great that the men can hardly sleep. Concerning the Scilly Bishops' Lighthouse, on a rock in the south-west of the Scilly Isles, of which the Commissioners say that the building is 'perhaps the most exposed in the world,' they give the report of the head-keeper that 'the spray goes over the top of the lighthouse,' the height of which is one hundred and ten feet. At the South Bishop Rock Lighthouse they were informed that 'spray occasionally strikes the lantern, and it has broken the lower windows of the dwelling-house'—that is, of the part of the tower so called. Yet the South Bishop Rock Lighthouse is on a rock—off the coast of South Wales—of such size that

there is a patch of grass before the door, and the tower rises to a height of one hundred and forty-four feet above the sea. The Smalls Lighthouse, also off the coast of South Wales, is on a low rock about twenty miles from land, but so large that there 'is room to walk about.' It is above high-water mark; but we are told, 'the sea breaks all about the lantern of the old lighthouse, and over the new building when there is heavy weather.' The 'old building' was a wooden lighthouse erected in 1778; the 'new building' a stone one in course of erection in 1859, when the visit of the Commissioners was paid. The Commissioners add, from information given to them by the head-keeper, that 'green seas pass up to a point about thirty-two feet above the level of the rock.' If this is the case in the Irish Sea, what must be the height to which 'green seas' reach on the lighthouse towers in the Atlantic Ocean! As to the force of the waves, although no stone had been removed from its place since the work of the new building began, an iron bar was shewn to the Commissioners, about two inches thick, and fixed in the rock, which had been bent like a wire.

The height to which the waves sometimes rise when they dash against rock, has been found at the North Unst Lighthouse to be far greater than appears from any of the instances already adduced. This lighthouse is one of the most recently erected on our coasts, and is of special interest as being situated at the most northern point of land in the British Islands. It is built on a *stack* or outlying rock of conical form, of nearly two hundred feet in height, at the north end of Unst, the northernmost of the Shetland Isles. The rock, as seen from the south, very much resembles a sugar-loaf in form; and its steep slope could only be scaled with difficulty, previous to the cutting of steps in it. On the north it is nearly perpendicular, and exposed to the full 'fetch' of the ocean. The top of the rock affords little more space than is sufficient for the site of the lighthouse. There is only one part of the rock where a landing can be effected, and that of course only in favourable weather; so that the light-keepers are as completely cut off from communication with the rest of the world as if their islet abode were many miles from land. The dwelling-houses of their families are on the island of Unst. The first light shewn here was from a temporary tower erected in 1854, at the suggestion of the Admiralty, for the benefit of the North Sea squadron in the Russian War. A temporary iron lighthouse and dwellings were constructed at Glasgow, and carried to the spot, with all materials and stores, by a steamer; and light was shewn after little more than two months, although landings were accomplished with difficulty, and everything had to be carried to the top of the rock on the backs of labourers. The temporary buildings being nearly two hundred feet above the level of the sea, it was supposed that they would have nothing but wind and rain to withstand. But in December, during a severe gale from the north-west, the sea broke over the rock, broke heavily on the tower, and broke open the dwelling-house and deluged it with water. Similar storms occurred during the winter: seas fell with violence on the iron roof of the dwelling-house, and on the lantern of the lighthouse, so that the light-keepers began to entertain serious doubts of their own

safety. It was resolved, therefore, to raise the permanent structure fifty feet above the rock. This lighthouse was completed in 1858.

Most lonely and remote from all the ordinary scenes of busy human life are the lighthouses of Skerryvore and Dubh-iartaig; towers of one hundred and forty feet high, on rocks in the Atlantic. Dubh-iartaig is a rock of considerable size, rising above the level of high-water, but over which the waves break in a moderate gale. It lies in the open ocean, twenty miles from the island of Mull, and a like distance from that of Colonsay. Skerryvore is a reef of low rocks, equally in the open ocean, about twelve miles from the island of Tiree, where the families of the light-keepers live, and about twenty miles west from Iona.

Life in such a lighthouse must be somewhat monotonous, notwithstanding all its duties and responsibilities. We are glad to learn that every lighthouse and light-vessel on the British coasts is provided with a library. We hope the libraries are really good ones, and contain a sufficient number and variety of books. But we are curious to know what amusement the light-keepers may at any time find, or what variety of incident, other than what arises from the changes of the weather and the sight of passing ships; and the blue-book already referred to tells us something of this, although much less than we could have wished. At Skerryvore they sometimes catch a few fish, 'such as little eel and rock-fish.' They occasionally see seals, but when the seals come about the rock no fish can be got. It is curious, however, how seldom in the notices given of the lighthouses anything is said about fish or fishing. We have been able to discover only two instances of the kind besides that of Skerryvore. We are told that at the Bell Rock the keepers catch a few fish; and that at the southern of the two lighthouses on the Maidens' Rocks—two rocks about half a mile apart, and eight miles from the shore, on the north-east coast of Ireland—they catch fish off the rock, and the head-keeper 'has a boat of his own, for the use of the boys to catch fish.' Probably, however, fishing is a more common amusement of light-keepers than can be learned from the blue-book, and it may be supposed that the Commissioners did not inquire very carefully about it. Of seals, mention is made only in one instance besides that of Skerryvore. The head-keeper at the Smalls Lighthouse once caught a young seal by descending from the tower and placing a bag in front of him as he slept. 'He poked him up with a stick, and in he went.' He was more fortunate than Hector McIntyre in the adventure with the phoca related in the *Antiquary*.

Birds are much more frequently mentioned in this blue-book than any other kind of living creatures. The head-keeper at the Smalls said 'that he had caught woodcocks in September, as also larks, starlings, and blackbirds. Five years ago, he caught a partridge on the night of the first of September. He thought that probably the shooting had driven him out to sea. "He was very fat indeed." It will be remembered that the Smalls Rock is twenty miles from land. At South Stack Lighthouse, which is on the west coast of Anglesea, on an island under a cliff, and joined to the land by a bridge, 'the sea-birds are preserved as a natural fog-signal, and are tame. Gulls sit on the walls and close to the lighthouse, and scream continually. A few white rabbits sat

among the young gulls, and seemed on terms of perfect intimacy.' The screaming of the sea-birds that frequent rocks and islets is again mentioned as a useful natural fog-signal, in the case of the Skerries, on the north-west coast of Anglesea. The Skerries Lighthouse 'is built on a low island of some extent, covered with birds, mostly terns, which are preserved. No other fog-signals are used here; but mariners can determine their position by distinguishing the noise of the birds which frequent these two stations'—namely the Skerries and the South Stack. We confess we would rather not be on board of a vessel whose position it was necessary to determine by such means, in proximity to rocks so dangerous. 'The birds which kill themselves against the lanterns' at the Skerries, we are told, 'are starlings, thrushes, blackbirds, larks, linnets in flocks, and ducks occasionally.' Of Copeland Lighthouse, on an island of considerable size at the entrance of Belfast Lough, we read, that the birds killed are blackbirds, thrushes, starlings, larks, linnets, ducks, and widgeons. At the Maidens, 'a few duck and teal are killed, but seldom.' At Skerryvore few birds are killed; those that are being mostly blackbirds, thrushes, and starlings. Once a woodcock was killed. At the lighthouse on Buehan Ness, a promontory in Aberdeenshire, starlings and blackbirds alone are mentioned as ever being killed. At the Bell Rock, few birds are killed; but thrushes and blackbirds occasionally are in winter. The birds killed at the Isle of May Lighthouse are starlings, thrushes, blackbirds, woodcocks, and small land-birds. It is added that 'no sea-birds ever kill themselves.' At the Fern Islands Lighthouses, blackbirds, thrushes, and ducks are killed, but not many.

Meagre as is the information thus collected, it is interesting. The opinion has long been pretty generally entertained by naturalists that birds of passage perform their migrations chiefly by night. We see flocks of swallows congregating by day, when the time for their departure approaches, but we rarely see them depart. Some morning we find they are gone. Other birds, it would appear, often choose the night for their flights. Is there in this a provision of nature against the dangers to which they might be exposed during the day from hawks and other birds of prey? Birds, it appears, in their nocturnal flights are attracted by a bright light, as insects are by that of a candle, or salmon by the torch that is used by leisters for 'burning' a river; and thus it happens that, flying with great rapidity, they dash themselves against the lantern of a lighthouse and lose their lives. But how is it to be accounted for that starlings, thrushes, blackbirds, linnets, and other non-migrating land-birds should in their flights go so far out to sea as some of the lighthouses where we are told of their being killed? What induces them to pass, as perhaps they are doing, from one shore to another many miles distant? These are questions which we cannot answer; but the facts upon which they are founded may help us to understand the general distribution of our native birds over all parts of the British Islands that are suitable for their respective habits and requirements. It is also particularly noteworthy that no sea-birds, such as gulls, terns, &c. ever kill themselves on the lighthouse lanterns. That this statement of the light-keepers of the Isle of May

accords with the general experience of light-keepers everywhere, appears from the fact, that no mention is made of any sea-bird as amongst the birds killed at any other lighthouse. Can it be that the sea-birds of the vicinity get familiarised with the light, and learn to avoid the lantern? Or are we rather to suppose that never flying by night, they are not exposed to its dangerous attraction? That water-fowl of the duck tribe are amongst the birds sometimes killed is not surprising, when we consider their powers of flight, and the migratory habits of some of them that come to our shores in great flocks from the arctic regions in winter. A case happened some years ago of a wild-duck which flew against the lantern of Flamborough Head Lighthouse, and smashed it—the lantern to atoms. The mangled body of the poor bird was afterwards picked up by the keepers.

It is much to be wished that some of the light-keepers of our lighthouses would make notes of their observations concerning seals, whales, birds, fishes, and other animals. Such records would be valuable; and might not some of them occupy their leisure hours in the study of natural history? They would find it a delightful resource in any of its branches which they might choose to prosecute; and we venture to recommend it to any of them who may read this paper. Interesting observations would then certainly be made, and new facts added to our stores of knowledge.

Life in the lighthouse is sometimes varied by the arrival of other visitors than seals or birds. The keepers of the Smalls Lighthouse told the Commissioners to whose Report we have been so much indebted, that 'a foreign ship once struck at the end of the rock in broad daylight. The crew, twelve men, leaped on shore; the vessel drifted about three miles and sank. On being asked how they fed so many men, the keepers replied that they always had six months' provisions when they came off.' Some lighthouses, easily accessible, are much visited during summer by tourists and pleasure-parties. Godrevey Lighthouse stands on a small islet off the coast of Cornwall, at the entrance of the Bristol Channel, and the keepers reported that the islet had been visited by a thousand people on Whit-Monday 1859. The head-keeper of the Skerries Lighthouse, when visited by the members of the Royal Commission, apologised for the condition of his lighthouse although they thought it in beautiful order—saying that it was not so clean as it should be, 'because two hundred and fifty school children and their teachers visited the island yesterday from Holyhead, in a steamer.' They drank half a butt of water, which is scarce at the Skerries, and would put their fingers on the brass-work.

Lonely as life in a lighthouse must often be, the keepers seem to be wonderfully contented with their lot. The under-keeper at the Smalls indeed, complained to the lighthouse Commissioners that it was 'rusting a fellow's life away.' But he was an exception to the general rule. The head-keeper at the same place had been eighteen years there. The head-keeper of Innishowen Lighthouse, at the entrance of Lough Foyle, was seventy years old, and had been fifty-six years in the service. Many have entered the service young, and have grown old in it. Yet the remuneration is not very great; certainly not more than enough, when not only the nature of the service is considered, but the

immense importance of a faithful discharge of its duties. The four keepers of the Bell Rock Lighthouse—three of whom are always on duty, while one is with his family at Arbroath—have each fifty or sixty pounds a year, with house and garden at Arbroath; a stated allowance of bread, butter, oatmeal, vegetables, and beer; fourpence a day for tea, and a suit of uniform once in three years.

INFECTIOUS DISEASE PROPAGATION.

ON this subject, correspondents of the *British Medical Journal* have lately offered some wholesome warnings. Dr H. A. Allbut writes as follows: 'There are three common ways by means of which infectious diseases may be very widely spread, and in the interests of sanitation, I desire to expose them. It is a very usual practice for parents to take children suffering from scarlet fever, measles, &c., to a public dispensary, in order to obtain advice and medicines. I need hardly enlarge upon the dangers which arise from such a proceeding, both to the children themselves and also to the public. It is little less than crime to expose in the streets of a town and in the crowded waiting-room of a dispensary children afflicted with such complaints. Again, persons who are recovering from infectious disorders borrow books out of the lending departments of public libraries; these books, on their reissue to fresh borrowers, are sources of very great danger. In all libraries, notices should be posted up informing borrowers that no books will be lent out to persons who are suffering from diseases of an infectious character; and that any person so suffering will be prosecuted if he borrow during the time of his illness. Lastly, disease is spread by tract distributors. It is the habit for such well-meaning people to call at a house where a person is ill and to leave him a tract. In a week or so the tract is called for again, another left in its place, and the old one is left with another person. It needs not much imagination to know with what result to health such a practice will lead if the first person be in scarlet fever or small-pox. The remedy for this is very simple: if tracts are necessary for sick people, let the distributors give (not lend) to the people in their districts.' He concludes by recommending 'all sanitary officials to use greater endeavours in order to detect and punish such evident violations of the law.' Dr Hatherly calls 'attention to another fertile source of infectious disease—namely, the letting out on hire of smits of mourning clothes for funerals. This practice is by no means uncommon in poor neighbourhoods. The clothing thus loaned out from house to house may be, in fact often is, introduced into very hotbeds of infection, and is, when not disinfected, a dangerous medium for the spread of infection.' Dr Hutton offers a warning on 'the reckless manner in which parents allow their healthy children to run into the houses of acquaintances who have members of their families suffering from scarlatina, &c. I have often seen children thus affected surrounded by a perfect levée of healthy playmates, and under my own observation, I have seen the infection thus carried from the patient, and several families attacked;

and only within the last month, two children in separate families lost their lives in consequence.' All very timely hints these. The misfortune is they are not likely to meet with much attention.

LOST JEWELS.

IN addition to the anecdotes which have lately appeared in this *Journal* upon Lost Jewels, a correspondent has sent us other two. They are as follow :

Some years ago I was admiring the handsome rings of a relative of mine, when I noticed upon her little finger an insignificant little ring of pale gold set with a bloodstone. 'Why do you wear that trumpery little thing?' I asked; and in reply she told me the following anecdote.

'The night before my eldest son was born, I undressed as usual in my big bedroom up-stairs, and put my rings into a little china plate (which contained some oatmeal used for washing my hands) on my dressing-table. I had only two or three rings at the time, and amongst them was this little bloodstone, which had been given me by a school-friend before my marriage. My boy James was born the next morning; and so it came about that for the next fortnight or three weeks I neither wore nor thought of my rings. However, when I was convalescent and dressed for the first time, I naturally looked for my rings, and found all there except the bloodstone. Search was made for it through the whole room, and afterwards through the whole house, but with no success; it was not to be found. I never thought for a moment that it had been stolen, for it is of little value; and this turquoise hoop which had lain with it would have been much more attractive to a thief. Years passed; and James was a sturdy boy of ten, when some alterations being made in the house, the flooring of my bedroom was removed. Under one of the planks was found the skeleton of a mouse with my bloodstone ring round its neck. It had evidently ventured upon my toilet table in search of the oatmeal, had unwittingly pushed its head through the ring, and had returned to its hole to die: an unintentional thief strangled by its useless prize.'

The second is an out-of-door story. A young lady, governess in a friend's family, was one autumn day walking with her pupils in their father's kitchen-garden. The children pulling at their governess's hands as she walked between them, loosened a ring which she wore, and before they noticed whither it sprang, the ring was gone from her finger and was nowhere to be seen. The garden-beds around, which had been newly dug over, were searched, so were the celery and cabbages growing near; but no ring was forthcoming. The governess mourned for the loss of her ornament, more particularly because it had been her father's signet-ring; and every day for some time she and her pupils searched the kitchen-garden, but in vain. A month afterwards she returned home for a holiday, taking with her a basket of garden produce, as a present to her mother from her pupils' parents: when lo! almost the first thing unpacked from the country basket was a fine hearty cabbage with a close green heart, amongst whose curled blades lay the much-lamented, long-sought-for signet-ring.

THE FALL OF THE YEAR.

BUSTLING leaves, which everywhere
Fall from branches cold and bare;
Fleeting sunshine, fading o'er
Breezy tarn and wind-swept moor;
Birds' last farewell ere they flee
To a land beyond the sea;
Moan of wintry wind o'erhead—
Nature weeps, for Summer's dead!

In my life a sad despair,
Empty hopes and aching care;
Vain regrets for Summer gone,
Lonely tears as days go on;
Vacant gaze and fruitless cry,
Dreary, dull satiety,
Moan at thought of kisses fled—
Memory weeps, for Love is dead!

But, though withered leaves and sear
Shroud with gloom the blossoms' bier;
Though the birds to other skies
Raise their amorous melodies;
Though the flickle sunshines woo
Brighter lands and seas more blue;
Shall not Spring's soft breath restore
Blossom, leaf, and bird once more!

And though Passion's heaven-born power
Lasted but for one brief hour;
Though those kisses heart from heart
Tore us—evermore to part;
Though alone I'm dreaming now,
And in thy last sleep art thou—
Death, perhaps, shall, some glad day,
Give thee back to me for aye!

DISTRIBUTION OF SEEDS BY PANTHERS.

Mr Alfred Smee writes: 'An interesting fact in natural history was revealed during the recent visit of H.R.H. the Prince of Wales to India. In one of the hunting excursions in the neighbourhood of Baroda a panther was shot, and numerous seeds were found to be attached to the skin. The seeds had two perfect hooks, manifestly designed to attach themselves to foreign bodies. As the panther moved about it collected the seeds on the skin and carried them about wherever it went; but when it rubbed against the shrubs, it of necessity brushed some off, and thus distributed them. These seeds were taken from the skin by an officer who was one of the hunting-party, and several came into the possession of Mrs Horner of Staines, a great lover of horticulture, who did me the favour of sending me specimens. I was so struck with the incident and the remarkable character of the seed, that, after accurately figuring it, I desired it to be sown at "My Garden," when it rapidly grew into a handsome plant, and produced beautiful clusters of tubular flowers. It was immediately recognised to belong to the genus *Martynia*; and on examination, both Professor Oliver, of the Royal Gardens, Kew, and Dr Masters agree that it is *Martynia diandra*, a plant which, although introduced into this country as far back as 1731, has scarcely ever been cultivated for many years. I have placed my specimen in the hands of Mr Sowerby, the Secretary of the Royal Botanic Society, Regent's Park; and the plant, with one of the seeds taken from the panther's skin, is now exhibited in the great conservatory.'

STORY OF THE MOSS HOLE.

STRANGERS travelling through Scotland will scarcely fail to be told of what wonderful things have been done during the last hundred years in the way of draining and improving land—the latest of these operations on a gigantic scale being those of the Duke of Sutherland. What has been done one way and another has, in a sense, made the country, which is now a very different thing from what it was in the days of Dr Johnson. The mountains, to be sure, are there as of old, and so are the rivers, but even the hills are changed in general aspect, for they are either clothed or envircled with plantations, or they have been inclosed as pasturages. As for the rivers, their course has been cleared, and in many places lined with embankments, to prevent overflow in the case of floods. The most marvellous of all the changes, however, are those effected on the valleys and plains. Beautifully laid out fields, divided by hedgerows or stone dikes, and brought to the highest pitch of agricultural productiveness, have superseded open moors, morasses, and pools of water.

How has all this been accomplished? It has been effected mainly by the outlay of large sums of money by the land-proprietors. Intelligence and skill have of course been the presiding agents. The improvement of land has been a fashion, a pride, we might almost say a craze, a mania. Naturally enough, the great land-owners, who belong to the peerage, have done most. And next to them as improvers may be ranked men, or the immediate descendants of men, who made fortunes by some species of mercantile enterprise, and took their place among the landed gentry. Old families with but a limited rent-roll, and some style to keep up, but nothing derived from any profession, are, of course, able to do little. You know their estates, as they cast up here and there, by the shabby palings for fences, the downcast old manor-house let in summer to strangers for country lodgings, the dismal half-grown-up ponds and ancient water-courses, superseded a century ago, and still remaining a melancholy token of

impoverished gentility. But these antiquated-looking spots are exceptional and disappearing. The general rule is active local improvement along with a profuse dispersal of money. From wealth-producing Lanarkshire, from Edinburgh and other centres of industry, from India and Australia have poured forth purchasers of estates, on which they have set to work, expending fortunes in reclaiming, planting, and ornamenting grounds, also in building picturesque mansions, till the result has become what we see before our eyes.

It is but justice to say that in all cases the land-owners of every degree could have done very little unless for the powerful support of an intelligent, discreet, and well-to-do body of tenant-farmers. It would have been of no use expending capital on land to be let to men who were devoid of means to work it on a liberal and remunerative scale. The old and poorer class of tenants being gradually weeded out, there arise men of substance as tenants, and who, as regards tastes and habits, differ little from the owners of the soil. Of course, these tenants look to their own interest. What they put into the land they expect to get back with a reasonable overplus in the course of their lease, and the expectation is usually realised. Fortunate men they must be considered! Houses in a good style built for them and their servants. Everything put for them in an excellent condition, while the numerous outlays incurred on their account by the landlord, often sweep away all the rent that is got for years. The mania for buying estates under obligations of this nature is certainly very curious. For the mere honour of the thing—that of being land-owners, and numbered accordingly among the 'upper ten'—fortunes are sunk on land, yielding for the most part not two per cent.; and as often, when rates and expenses are included, not one per cent., if anything at all. Happy land, where there is so much patriotic expenditure!

We propose to tell a little story about land improvement, which may be called the Story of the Moss Hole. It is a narrative illustrating the manner in which landed gentlemen in Scotland

have often been obliged by force of circumstances to put their hand in their pocket to effect objects which were of about as much concern to the public as to themselves. We advisedly say to the public, because any costly operation in removing eyesores from a landscape, at the same time improving climate, is a matter of public importance. All drainers from the Duke of Sutherland downwards, while perhaps looking chiefly to their own tastes and immediate interests, may be viewed somewhat in the light of public benefactors.

The Moss Hole was a hideous-looking though not extensive morass on an estate having a mile or two of boundary on the Tweed to the south. The morass was situated in the hollow of a field not far from the river. In shape, it was a parallelogram, ninety-six yards long, and twelve yards across. On the surface grew coarse grass and rushes. Beneath, there was dark moss, and pools of water were seen at various spots. The water was known to be the domicile and breeding-place of thousands of frogs, which at certain seasons went forth to recreate themselves in the neighbouring fields and ditches. The water being semi-stagnant, was the source of a kind of malaria. From it, in certain meteorological conditions—as, for instance, in cold evenings succeeding a warm day, or in sudden morning chills—there arose low creeping mists, which hovered about until dispelled by the rays of the sun. The only outlet to the water in the morass was by a small run, which, getting into a ditch by the roadside, slowly trickled to the Tweed, by means of a culvert below the railway.

No one could give any information regarding the history of the Moss Hole, as it was popularly named. For what anybody knew, it might have existed since the beginning of the world. Each successive proprietor of the lands had in his turn been an improver, but all had successively refrained from meddling with the Moss Hole. They let it alone, as something too sacred and serious to tackle with. So there it was, always as stagnant, and always as full of frogs as ever. From its shape and position it almost cut the field in two, and consequently it offered an interruption to ploughing and other operations; yet, as its eradication would possibly have added but slightly to the estimated annual rent of the farm, any inconvenience from it was endured. There are eyesores and nuisances, however, not to be tolerated on the score of cost of removal, or what money will be directly made by getting rid of them. If considerations of that kind had prevailed, alas for the sanitary improvement or beautification of the country! The market-value of most landed estates does not depend on the actual return in shape of rental—that indeed, as already said, being often very small—but on the attractiveness and other generally recommendable qualities of the property. Yet, with a knowledge of this fact the successive proprietors of the land in question let the Moss Hole in all its hideousness continue to exist, and to all appearance it was destined to be a local annoyance till the end of time.

When the present proprietor entered into possession a number of years ago, he viewed the Moss Hole with disgust, and resolved on its extirpation as soon as some more clamant improvements and ornamentalions were effected. There was a farm-

stead to be modernised at a heavy cost. New cottages for labourers had to be built. Much planting for the sake of shelter had to be done. Roads and footpaths had to be laid out in a creditable style. Fences had to be repaired. An artificially irrigated meadow, the whim of a previous proprietor, had to be made into dry land, as it caused ague and bred hosts of black slugs, which nauseously crawled about in all directions. These and a number of other things, calling unitedly for an outlay amounting to five figures, required to be got out of hand. In short, no proper opportunity occurred for attacking the Moss Hole until the summer of 1876, when the surrounding field was in grass, and when a new tenant-farmer could be dealt with. It was agreed by mutual contract that the proprietor should be at the expense of draining the Moss Hole, and that the tenant should only do the drivings of material with horses and carts, from an adjoining knoll, to fill up the morass. When finished, the land, without any additional charge, was to be part of the available surface of the farm. It was a simple arrangement, convenient and beneficial to both parties. The tenant-farmer would have a benefit, whatever that was, of nineteen years' occupancy, incidental to the improvement. The landlord would have his property permanently improved. We mention this as a common method of improving lands in Scotland. The proprietor lays out the money; the tenant, in view of his nineteen years' occupancy, recoups himself for the temporary use of his carts and horses; such use being, as far as possible, at a season convenient to himself.

The project for extinguishing the Moss Hole getting wind, a considerable sensation was created in the neighbourhood. There were dreadful auguries as to what would ensue. 'The Moss Hole is of tremendous depth. No proprietor has ever dared to meddle with it. Any one who ventures into it will be drowned. Its bottom is far below the level of the Tweed, and any attempt at its drainage is out of the question. The cost of filling it up, if it ever can be filled, will be immense. It is not very nice to look at, but it would be much better to leave it alone. It does no harm to anybody. What signify the few paddocks that come out of it? Nobody cares a pin-head about paddocks. They are innocent creatures, loup, loupin; aboot.' Such were the dismal and grotesque prognostications on the subject. As an old habitué, the Moss Hole was to a certain extent venerated. As a waif and stray, which neither landlord nor tenant looked after, it furnished (at some trouble, but that was nothing) crops of rushes and rough grass, to be dried as bedding for pig-sties, and so far it was a popular institution.

Well, the terrible day arrives when the Moss Hole is to be attacked. The first thing done is to ascertain its actual depth. There, close on the margin, stand some labourers with their pickaxes and shovels, ready for anything. The superintendent of works speaking in a quiet way to the longest-legged and presumably the most skilled of the men employed, says: 'Robert, I think it would not be a bad plan for you to walk right through the Hole from end to end, and crosswise back and forward, with a good long stick in your hand, to find out how deep it is.' A neat suggestion this: to walk into a renownedly bottomless

pit. It was almost as bad as asking a man to lead the forlorn-hope, and run a hundred chances to one of being shot. Robert, an experienced hand, as joyous as if going to a wedding, fears nothing. Without a moment's hesitation, he heroically plunges into the Hole—stockings, shoes, trousers, and all. The plan adopted to discover the depth was not perfectly scientific, but it answered quite as well as the most learned device that could have been fallen upon. Poking about, Robert keeps his footing, sometimes up to the knees, sometimes up nearly to the waist. With his stick he accurately ascertains the various depths, and if of any use, he could have drawn up a chart of the soundings. It was sufficient to know that the morass was at most only from three to four feet deep. This settled the question as regards the possibility of drainage.

Country people know little of the theodolite. To calculate levels, they ordinarily use what they call boring-rods; these are sticks with a cross-piece along the top like the letter T, over which, from point to point, they look with one eye shut in a knowing sort of way, and by this rough and ready contrivance—which we have no doubt is of vast antiquity—they will engineer a gradient to a nicety. The boring-rods, aided by a spirit-level, were in constant requisition for the Moss Hole. It was conclusively discovered that from the lowest point in the morass there would be an outfall of twenty-four inches to the culvert adjoining the Tweed. That was good news. The Moss Hole stood condemned as an impostor. Its doom was sealed.

All was now plain sailing. Operations were commenced by excavating a sufficient drain from the outlet to the culvert underneath the railway. In this preliminary part of the business there was hard work, but no sort of difficulty. After excavating the required depth, and allowing for a gradual fall, the cutting was laid with glazed tile-pipes nine inches in diameter, cemented together with Portland cement, so as to form a continuous water-tight tube. When completed, the length of this spacious tubular drain was a hundred and six yards. The water ran through it in a copious stream. Then ensued the active operations on the morass. A drain was cut along its southern side from end to end, and several tributary drains were cut diagonally crosswise. This was the nastiest part of the undertaking. The workmen stood in water with feet and legs constantly wet. There they were hacking away at the black moss to make clear runs for the water, which poured out on all sides. There was this satisfaction, that the more they cut into the moss there was the less water to run out, until at length no part was undrained. The moss, like heavy black mould, was wheeled in barrows to the side.

It was interesting to note that in proportion as the water was drawn off, the top of the morass sunk, until one could walk on it with a firm footing. In the various operations, it was not pleasant to observe the discomposure of the colonics of frogs, which never could have contemplated so rude and sudden an invasion of their ancient domain. Sprawling about, a few got away, but the greater number perished as victims of a relentless act of rural improvement. 'Play to you, but death to us,' as was said by the frogs in the fable. Two or three eels were secured,

which duly figured at table in the 'Big House,' as 'Stewed eels à la sauce Matelotte'—as delicate a dish as could be presented to a Parisian gourmet.

In laying bare the foundation of the morass, no objects of antiquarian interest were discovered. No one could squeeze a bit of romance out of it. The hollow had simply been a convenient receptacle for field-drainage and rubbish. The laying down of common drain-tiles, four inches in diameter, throughout the several runs, in connection with the great tubular drain, concluded the artistic part of the process. Rough stones were packed well in, to allow the free percolation of water to the drains. Nothing remained but to bring up the surface to the level of the field. This was accomplished in the first place by pouring in upwards of a thousand cart-loads of stones and gravel. Next by wheeling in with barrows the mossy material that had been laid aside, mixed with quantities of coarse sand, to give a proper consistency to the soil. In adjusting the surface, it was made to piece in with the slope in the field. The job was at an end; and much merit is due to all who with little regard to their own comfort, helped to complete the undertaking. After a few years' culture, the spot will be scarcely distinguishable; as is thought it will be exceedingly fertile. The cost of excavation, drain-pipes, and other items of outlay, with workmen's wages, altogether amounted to less than forty pounds, a sum considerably below what was anticipated. Had it been much more it would have been well-spent money. To say nothing of the improvement in climate, a blenish has for ever been removed from one of the fairest scenes on Tweedside.

Such is a little bit of specimen of the way in which Scotland, as we now see it, has been made. And many a hundred gentleman, thinking of his numerous outlays, would add, with a half-humorous half-pensive shake of the head: 'THAT'S HOW THE MONEY GOES.' W. C.

THE ARAB WIFE.

A TALE OF THE POLYNESIAN SEAS.

CHAPTER XIII.—HOME.

ACCORDING to my imperfect knowledge of the science of navigation, and by calculating the turns and twists we had made, and allowing for the currents, I concluded that the pirogue could not be very far from the English settlements in West Australia. The shore trends inward considerably to the south, and as I had kept well out to sea, we were quite a hundred miles to the westward, and had to make much more distance than I supposed, so that instead of making the land at noon, it was near midnight before I caught the first glimpse of it in the moonlight. It was right ahead. I ran down for the charts, lit a lamp, and began to study our whereabouts, whilst Fatima without a word went up to the wheel.

After puzzling my brains for some time, I at length realised that we were considerably south of Perth, where I intended to arrive; and that the bold headland on the starboard bow must be Point Naturaliste. As this was evidently so beyond a doubt, by the peculiar configuration of the coast, which here makes a right angle, it was equally plain that we must stand again to the north, make a bold turn eastward, and then run in to

Augusta. There was not much time to lose, as at midnight Bikur would come to take the wheel; so I went on deck and stood clear out to sea again; and by the half-hour that elapsed before the negro came up, the land in rear of us was the merest speck, almost imperceptible to negro eyes, more especially as Bikur looked for it steadily in the wrong direction.

When I relieved him in the morning, we tacked dead to eastward, and ran so for an entire day, sighting various coasts, which surprised Bikur much. We were too far off to distinguish the coasts, so that he remained ignorant of their being white men's vessels. But he pondered something greatly all day long, and Fatima and I agreed to watch our sable friends narrowly. After running considerably to eastward, I commenced a series of tacks in the supposed direction of Augusta, and as it is a city set upon a hill, had little difficulty in making it. Then Fatima got Yarifa to come and see the land, after which we closed the hatch, and ordered both the negroes to remain on deck. The numerous schooners and sloops, and occasional small steamers, which were either coming in or going out of the port, convinced them that we had arrived at some great city; but they saw clearly that we had deceived them, and had sailed to the white man's country. My feelings of rapture would be hard to describe, and I know that I hailed every vessel that came near, from the delight I had in hearing the hearty English words from my own countrymen. There are French settlements north of Augusta, and German villages east of it; but the immediate vicinity is populated, as is the city itself, exclusively by English people from the southern counties; so to hear them speak was just like being at home. Tears rolled down my cheeks, and Fatima softly pressed my hand, as if to tell me that she sympathised with me, and was as happy as I.

The wind chopped round to the westward, and favoured the pirogue, which moved like a thing of life through the placid waters of the broad harbour, sparkling with the sails of hundreds of small craft. Soon we came abreast of the city, and anchored within five hundred feet of the principal block. Then I called Yarifa and Bikur, whose curiosity had greatly overcome their feelings of surprise, and told them both that they were free either to go with us or to stay in the city where we had arrived, or to go elsewhere, as suited themselves; but they were no longer slaves, for the country in which we had arrived was one where there were no slaves, but all men were free. They both elected to follow us, and made many protestations of affection and fidelity, which time has proved to be sincere.

Having arranged that Fatima and Yarifa should stay on board, Bikur and I got into the sampan and paddled to the shore. Our Arab dresses were so conspicuous that I felt a little alarmed about the attention I might receive from the street boys; but on landing I was agreeably disappointed. We indeed were followed; but the juveniles thought we were members of some outlandish inland tribe, and refrained from any unpleasant demonstrations of regard. Meeting a mounted policeman, who had all the manner and bearing of an old cavalry-man, I asked him where I might find some official, the captain of police, the sheriff or governor, or something of that sort. He gave me the

address of the captain of police, whose name was the same as my own, and I hastened there at once. I found quite a genial soldierly man, who was a distant relative of my father's, and had known Uncle Joe perfectly well. I explained to him my position, and recited enough of my adventures to excite his warm sympathy. He immediately offered us rooms in his own house, and insisted on my taking some of his clothes, which I was glad to do. The metamorphosis was soon completed; and I borrowed his carriage, driving down to the jetty with the captain's servant, and engaging a stout six-oared boat, which soon took me to the pirogue. Taking with us Fatima and Yarifa, together with the most valuable of our treasures, we hastened back, and were soon in my cousin's hospitable home.

Mrs Wade took charge in the kindest manner of Fatima, and soon fitted her out with the dresses and toilet articles of European fair. The transformation was complete. Never had Fatima seemed more beautiful; and I viewed with secret complacency the ease with which she adapted herself to European customs, and the innate grace and good-breeding which excused her blunders. But when on the next day I was obliged to inform Mrs Wade that we had so far been united only by the Arab teacher, she immediately proposed that Fatima should be baptised, and insisted in the most obliging manner upon serving as her god-mother. This brought about a confession from me that I stood in need of the same good offices, having become renegade; and it was mutually agreed that we should both be baptised, and then married again according to the Episcopal Church of England. The report of our adventures soon got wind, and I cautioned Fatima to say nothing about the casket or our other treasures, as it might make the captain's house a special object of regard to the ticket-of-leave men who find their way to this settlement from the penal ones. Our blacks, knowing no English, could not betray us, and their stories would naturally be so marvellous that nobody would credit them even if they could have spoken like natives. But even without a knowledge of our jewels, or of the crisp contents of the Dutchman's desk, we were exceedingly interesting to the townspeople of Augusta; and the governor called upon us, and insisted upon being god-father for my Fatima, his wife and Mrs Wade being her god-mothers. This is according to the ideas prevalent in the colonies, where a boy has a god-mother and two god-fathers, and a girl the converse.

The appointed day came at length, and we were admitted into the bosom of the Church in the presence of all the leading families of Augusta. We were thus re-united in the afternoon of the same day; and I folded to my arms the blushing Mrs Wade, Isabella now, instead of Fatima. There was a grand feast in the evening at the governor's house, and my wife in white satin was the admired of every one. But the rubies which she wore on that occasion were so far beyond anything that had ever been seen in Australia, that I am afraid some people of questionable taste paid more attention to them than to the wearer, who, in the wedding-dress of a European, must have been an object of envy to many a fair lady present.

We remained for some weeks at the governor's house, and then at his suggestion sailed in our own

piroque, which—in addition to the faithful couple who had been companions of our wanderings, and whom we decided upon taking with us to England—was now manned by a stout crew of good seamen. Our friends in Augusta were so obliging as to express great regret at our leaving; but the natural impatience of a son to see his father was sufficient excuse, and we departed for Port Phillip laden with a thousand good wishes, and delicacies of every description. We reached the Port without obstacle or adventure, and were soon whirled with all our belongings to Melbourne. I had preserved a faint sort of a hope that I might find my father there; but on consulting with the lawyer who had managed his affairs, I learned, to my sorrow, that he had sailed for England, to take measures for finding me through government authority; and taking with him poor Uncle Joe's fortune to the enormous amount of six hundred thousand pounds. I then inquired for Captain Orde, and was delighted to hear that the *Shooting Star* happened then to be in the harbour, and the honest Yankee captain at the Auckland Hotel.

Thither I repaired in all haste, and found the good fellow, who at first did not recognise me; but who, when I made myself known, fell upon me with the gripe of a bear, and hugging me in his arms fairly wept aloud. I was greatly moved by this display of affection in one so apparently cynical, and I think there was water in my own eyes. He accompanied me to the Victoria, where we had put up, and I introduced him to my wife, whom he pronounced to be the finest creature he had ever beheld, without even the exception of the Boston belle to whom he had once paid obeisance. I narrated my adventures at full length, as he consented to pass the day with us, and was sincerely thankful to him for the sympathy he shewed. For a cool business man, with a slow methodical deliberative manner, he was the most feeling man I ever met; and I must say that Americans generally are of this type. When I had concluded, he made me repeat parts over and over again, and at length volunteered to send, or himself carry an account of our whereabouts and welfare, to the Reis.

He also volunteered to restore the piroque, minus its crew, to the Nizam if I chose so to dispose of my now no longer serviceable little bark. To this, fearing for his safety, I at first demurred, but finding that expostulations were in vain, I at length assented. 'I am not afraid,' said he, 'to meet the Nizam, and feel quite able to run the risk; but,' he added, 'my good young fellow, you get off to England as fast as you can, and comfort your father's heart. He knows you are not dead, and has gone to interest the government in your release.'

To offer money to this noble-hearted American captain would have been insulting; so a happy thought occurred to me—a tangible way of shewing my appreciation of his courage and generosity. Selecting one of the jewels given to me by my father, and which I had been fortunate enough to preserve through all my wanderings, I got my darling wife to press it upon the skipper. 'Dear friends,' faltered he, 'I shall wear this for your sakes, and for the sake of my gallant old friend, whom I may never see again.'

So bidding our adieus, I sailed with Mrs Isabella

Wade and our two attendants for old England, in one of the great clipper liners. *The Golden Fleece* was a huge vessel of four thousand tons, and we had a grand cabin; but we both agreed that the little cabin of the piroque was more pleasant. However, on rounding Cape Horn we admitted that perhaps it was more comfortable in *The Golden Fleece*. Our trip to England was just the same as other trips. My wife improved so greatly in European ways that before we arrived at Southampton one could hardly suppose that she was not European; her skin was so very fair that she would easily be taken for a brunette English girl.

Arrived at length in London, we went to the only hotel I knew, Long's; and leaving Isabella to her own devices, and our two servants in special charge of the landlady, I set off in quest of our army agents, who directed me to the Hummums Hotel, Covent Garden. It is a famous place for old Indian officers.

Returning to Long's, I ordered a carriage, and desired Isabella to put on her bonnet, which she had learned to wear with perfect grace. We were soon together in the carriage and rolling off to the Hummums. I sent up to the colonel's rooms to say that a gentleman and lady wished to see Colonel Wade; and he sent back word that he was unwell, but would be happy to see the persons if they were intimate friends. We went up; and in another moment I was clasped in the dear old gentleman's arms. My wife had her turn of embraces; and over the happiness that followed and that has continued to be our lot, I discreetly drop a veil.

[Although we have given the foregoing narrative very much in the words of the writer, we would take exception to his having seen either deer or monkeys in Australia, neither of these tribes being indigenous to that country. The kangaroo is a native; and the 'large kind of rabbit' and 'miniature kangaroos' were doubtless marsupial animals allied to the bandicoot.—Ed.]

WINTER VEGETATION.

THE animal world is keenly sensible of the approach of winter, a season during which many creatures take a long sleep. The mole retires to her nest; the dormouse, having laid in store for bad weather, comfortably settles herself in a cosy nook of a dry old tree; squirrels and field-mice shut themselves in with their friends, only venturing out occasionally when the sun may shine with unusual fitful brightness; frogs sink to the bottom of ponds and ditches, and bury themselves in the mud; lizards, badgers, and hedgehogs creep into holes in the earth, and remain torpid till the spring; bats get into old barns, caves, and deserted buildings, where, suspending themselves by their hind-feet, and covering themselves in the membranes of their fore-feet, they sleep away in a sort of natural hammock till the green leaves come again.

Vegetation sympathises with the general repose, and we confess to a feeling of tender melancholy at this season of the year. The conditions of growth are suspended during the winter months in all our large trees, and the leaves drop off, because

their wants are no longer supplied by their parent tree. The autumnal tints, which are so beautiful in many places, are due to the oxidation of the green colouring matter in the leaf, which is developed under the strong light and sunshine of the summer. When the functions of the leaves can no longer be performed, from the absence of nutrition and the withdrawal of light from their surface, their tissues become choked, and they dry up, wither, and fall off. At the point of union, however, where the leaf-stem was fixed to the branch, Nature has already begun to prepare for future life; and the little nodule, which can easily be seen where the faded leaf once flourished, contains the embryo future glory of the forest.

The life of all plants—in fact of all living bodies—may be said to consist of a rotation of matter; some of the matter which exists in the living organism to-day will have passed away to-morrow, and a new portion will be formed by the appropriation of fresh material from without. In a very short time the whole organism will have parted with all its original substance, and the individual will consist of entirely new elements. This rotation of matter constitutes life; and when the mystic wheel ceases to revolve, death ensues—to the individual, though not to the family. The processes of life are more vigorous and active in the higher forms of vegetable life than in the lower; hence our forest trees require light and warmth to evolve their vital forces, and to carry on their functions; when these are withdrawn, all their powers are quiescent, dormant as it were, till the return of spring.

Those whose attention has been directed to the operations of Nature find deep sources of interest even in the winter repose of vegetation. Even in the dreariest period of this condition the horse-chestnut tree is easily distinguished by its large nut-like buds, which characterise it when its leaves are all faded and gone. There they are, on its thick and heavy branches, covered with a shiny coat of sticky gum-resin, which protects the tender interior from injury by cold or wet. When, as the year advances and the sun gains power, this gummy coating melts under its influence, the tender leaves it sheltered begin to expand and very soon attain maturity. But if in our winter walks we pluck one of these shiny varnished buds and examine it, we find matter for thought and study. Cut perpendicularly through this bud with a sharp pocket-knife, and then we see, closely packed and well protected by a series of outer scales covered with varnish, the rudimentary leaves which are to clothe the tree next year. The scales are arranged over one another in the manner of the tiles of a house. In the centre of the bud is situated the tender vital growing-point, which would be injured by the least frost, and is thus kept warm and well protected by its surrounding covering. But lest this should not be sufficient to secure the safety of this vital point, a substance similar to wool is developed in the cavity of the bud, in which the infantine leaves and the precious centre-point are tenderly wrapped. All this may be seen and explained to the youngest child in the course of a winter morning's walk.

We cannot hide from ourselves that the enchantment of a country lane is gone in a great measure with the past summer. The red berries are seen on the bushes where so short a time since we pulled sweet dog-roses, gathered fragrant honeysuckles, or filled our baskets with the purple blackberry. But whilst basking ourselves in the summer sun and recklessly pulling luxuriant and verdant garlands from the hedges, we forgot to look on the bank beneath the hedge, or to cast an eye on the old gnarled trunks and branches of the trees, then laden with delicious foliage. The soft and verdant mosses were hidden then by the long grass; the curious and beautiful lichens and fungi had not as yet appeared to any advantage in their favourite nooks and corners; or only blended in their varied shades of colour with the mass of beautiful vegetation by which we were then surrounded.

Now that the hedges are no longer green, and the trees stand black and bare on the landscape, is the time to seek for endless variety, and beauty waiting to be admired in its turn. What miniature fairy glens and grottos are distributed over the hedge-banks of our country lanes! Mosses, delicate and beautiful, may be found in the interstices of any old wall, or at the foot of almost any tree or shrub. The bole of an old tree is luxuriant with them, for they seem anxious to cover with soft green tapestry the rough bark, knotted and marked by time. It is in the winter-time that most mosses and lichens are found in fruit, and beautiful objects they are. A pocket microscope lens is essential for their proper observation, and though the delicate earthen cups of the species known as the cup moss, and the familiar gray and yellow mosaic appearance we see on twigs and branches on our way are easily recognised, the study of this form of winter vegetation is an inexhaustible one, and is an occupation for a lifetime, if earnestly pursued. We do not, however, suggest that every one who endeavours to recognise the different species of moss, lichens, or fungi should necessarily do so through the medium of the microscope; but it will greatly add to the pleasure of making a collection out of doors if there be a good microscope at home, so that when the contents of the basket be turned out after the winter's walk, there should be interest even in the fragments left after a little pile of varied bits has been constructed, rivaling the choicest summer bouquet in beauty of form and colour. We have seen such a collection formed into a beautiful object by raising a little mound of rough bits of bark in a plate or saucer, and placing on it varieties of fungus of every shade of red, brown, yellow, and gray. They seem to spring forth from a bed of sphagnum or bog-moss of brightest emerald green; while a clump of the screw wall moss in fruit, with its curious little box-like capsules, supports a gray or yellow lichen, which has been gently removed from some old wall or tree. A bit of stick or a twig incrustated with a bright orange-coloured lichen, supports a trailing branch of delicate green ivy, the most beautiful and adaptable of all winter foliage. Over this little arrangement is placed a bell-glass, to preserve it from dust and the effect of a dry atmosphere; and we know how pleasing to the eye is its varied beauty of form and colour, lasting thus, a constant source of pleasure, for many a day without renewal.

On their native banks, the soft green velvety mosses form dense masses. Looking with a magnifier into their luscious green, it seems like the entanglement of a deep forest with its recesses of gloom and shade. Many of the species give in their little outlines the perfect figure of a tree—the branches spreading unbragously from a tall bare stem, and losing themselves among the foliage, as if it were a chestnut or an ash instead of a moss. It is curious to see sprays of some species in which the characteristic green is richly tinted with gold; and often may these lovely forms be found on the surfaces of stones and rocks, and on the barks of aged trees, where the surface is moist—the frost-flowers of the window-panes transferred, as it were, to the country, and endowed with verdant life. These are the little plants that form on the prostrate trunk, green and swelling cushions and natural sofas, that, as Mr Ruskin tells us, ‘full of pity, cover the scarred ruin with a strange and tender humour.’ Under favourable circumstances, they form a compact mass, which may be lifted up and removed like a carpet from a floor, bringing with it a thousand little fruit-stalks.

Another set, represented by the genus *Sphagnum*, is characteristic of swamps and morasses. Vast tracts of such country are covered with this sort of vegetation where nothing else will grow. Lichens, on the contrary, are seldom found in damp places, but grow chiefly on old dry wood and on rocks and stones. *Parmelias* of all kinds seat themselves on old churchyard monuments, on the ruins of abbeys and castles, their bright yellow eccentric patches contrasting finely with the covering of ivy around. Others cling to the branches of trees, and hang from them, gray and shaggy, like an old man's beard, to the depth of many inches, or even feet. These are often improperly called ‘tree mosses.’ We read in *Kew's Catalogue* of the ‘forest primeval, the murmuring pines, and the hemlocks

Blended with moss and in garments green, indistinct in the twilight,
Stand like Druids of old with voices sad and prophetic,
Stand like harpers hoar with beards that rest on their bosoms.

Independent of seasons, when other plants are gone to rest or decay, the diversified hues and forms of this curious lichen family ‘make glad the solitary place,’ and beguile the winter's walk of its dreariness.

Whilst in their youngest and undeveloped state, lichens often appear as a mere powdery or scurfy wash on the branches of trees, palings, &c., and at one time were believed to be distinct species, and classified accordingly. Green is a very rare colour amongst lichens; they are chiefly gray, white, or yellow; and the fact of being green, usually suggests that the specimen is a moss, and not a lichen. The fructification of lichens is usually seen in the form of minute saucers or of tiny shields, which are not always circular, but vary in shape, and are called *apothecia*. The tiny ‘letter lichens’ which inhabit the smooth bark of trees, especially that of young beeches, resemble inscriptions in Hebrew or Arabic. We might almost fancy in the depths of the unfrequented forest that we had come upon the literature of the Dryads, or that the ‘good people’ had been at work.

Of the endless variety of fungi—mushrooms

or toadstools—which grow almost everywhere, Dr Badham writes: ‘What geometry shall define their ever-varying shapes? Who but a Venetian painter do justice to their colours? Some are stilted on a high leg; others have not a leg to stand on; some are bell-shaped; many shell-shaped; some like a lawyer's wig; others like a horse's hoof or a goat's beard. In one you look into the fungus through a thick red trellis that surrounds it. Some exhibit a nest in which they rear their young; and not to speak of those vague shapes,

If shape they can be called that shape have none
Determinate,

of such tree parasites as are fain to mould themselves at the will of their entertainer (the fate of parasites whether under oak or mahogany), mention may be made of two, of which the forms are at once singular and constant; one exactly like an ear clings to several trees, and trembles when you touch it; and the other, which lolls out from the bark of chestnut trees, is so like a tongue in shape and general appearance, that in the days of enchanted trees you would not have cut it off on any account, lest the knight to whom it belonged should come to claim it of you.’

The greater proportion of fungi are autumnal; many are, however, in perfection in midwinter, and it is in the very early spring before the leaves appear on the trees that we find the beautiful crimson Dryad's cup, a circular basin of the richest carmine, of about an inch and a half in diameter. To the delight given him by this crimson cup, Fries the great fungologist attributes his first incitement to the study of this class of plants.

Occasionally in a mild winter we hear of a stray violet or primrose being found on some sunny bank; but whilst we may reasonably expect to find, in our winter rambles, botanical treasures and curiosities such as we have mentioned, we can well afford to wait till the spring for these lovely familiar friends, and spend our winter hours in making the acquaintance of fresh forms of vegetation. Two plants seem essentially connected with all our recollections of winter, and whilst thinking of winter vegetation we can never forget them. The evergreen holly and the mistletoe are in their glory at this time, associated with the ideas of winter merry-makings, family gatherings, and Christmas observances. At the season of the year when we see most of the holly, it is often in company with the mistletoe; and if our winter rambles take us through an orchard or into an apple-growing country, we are sure to see its pretty light green clusters, ornamented with its pearl-like berries, on the branch of some old apple-tree. Much has been written of the mistletoe and its habits, and observers tell us that it is so seldom seen on the oak, that its very rarity is thought to have given the oak-fed mistletoe peculiar sanctity in the days of the ancient Druids. Be this as it may, we may well exercise our love of discovery by keeping an eye on all the oak-trees in our winter's walks, with the hope of finding the mistletoe in its mystic position, as of old.

We venture to trust that the foregoing observations may tend to prove that even in winter, when all around seems to wear the aspect of desolation, there are objects well worth search by those who

will give themselves zealously to the task. Lowly though these lichens and mosses and fungi may appear to be, yet when examined with a keen spirit of inquiry, they will be found to reveal beauties hitherto concealed, and will repay the trouble of many a winter day's ramble. P. 1.

AN OLD MANUSCRIPT.

CONCLUSION.

I CHANCED to be at work in the garden summer-house one afternoon, the weather being very fine, when, although it was scarcely our time of meeting, in came Mr Salkeld, and somewhat hesitatingly sat himself down beside me. He held a letter in his hand, which he desired me to read. It was a presentation of a living from an old college friend. I was both glad and sorry at the news, and so I told him. He was silent for a few moments, and he looked so strangely out of his wonted composure, that I began to fear that I had hurt his feelings by the manner of my congratulation; and just as I was about to allude to this, he turned and regarded me quite suddenly with a look in his eyes I had never noticed there before, a look that made me sink into myself, as it were. I almost instinctively felt what the tenor of his next words must be. They were these, and he spoke very solemnly, as a man speaks when his deepest feelings are moved. 'Miss Wilfrid,' he said, 'I thank you for your good wishes; but let me say, that much as I am devoted to the sacred profession in which I humbly strive to do my duty, there is yet another devotion which is also to me greatly sacred—love that is second only to the great devotion of my life. The new life that is opening to me would be cold indeed if, going there, I might not carry that human love with me. Carry it with me indeed I shall, but it rests with you to say whether I shall carry it in sorrow or in great joy.' Here his voice was solemn and beseeching almost to sadness, and I could not speak, for my heart was too full. Then I knew not how it was, but he had told me that he loved me so well that all else on earth had no comfort for him were I not by his side to sympathise, to aid him, and rejoice with him in all things.

I knew not what answer I gave him, but I was clasped in his arms, and all seemed confusion. I could neither think nor speak, and I was only aware of one wish—to be alone for a time, to collect my thoughts; but I left the summer-house leaning on Arthur Salkeld's arm as his affianced wife. We walked through the rose-garden into the house—he with a tender look of happiness on his face that has wrung from me since many a sigh of sorrow.

I went up-stairs to my room, the room that in my happy lightness of spirits I had named the Rose-chamber. The roses were nodding at the window as they had done that spring morning twelve months before. I sat down near them, and thought of the lark's song I had listened to in rapture that fresh May morning. Was I as happy as then? To be his wife—the man that of all others I respected and trusted—the beloved of all who knew him, rich or poor! I was perplexed; my brain was in a whirl. Thought after thought rose in me like wave on wave; but ever a sadness grew upon me that thought would not and could not

drown. Did I wish the event of the last half-hour undone? No! I would not, dared not, wish that. But something within me mysteriously whispered that all was not well. Had he been mistaken in his choice? I shuddered at the thought, and strove hard, so hard, to dispel it. Did I truly love him? Was I happy in that this great love of a good man had been bestowed upon me, so unworthy as I felt myself to be? 'O for the echo of that lark's song,' I said to myself, scarcely knowing that I did say so. But no echo of gladness seemed to come to me; but only still a sad, sad, yearning, anxious hunger of the heart that I could not understand. O blind, wickedly blind that I was! The years have gone since that day; and in those years how well have I known the meaning of that wistful heart-sickness which crushed every impulse of hope and joy in me with leaden force.

I did not go down-stairs all that evening, for I felt that I could not meet his earnest gentle looks, nor share in his deep tenderness as I ought. I sent down a plea of illness; and indeed it was no idle excuse. Miss Stanhope came to me with kind messages from the gentlemen, and words from Arthur Salkeld that went deeply to my heart.

The next day I was more composed, and I met his eager questions about my health with real gratitude. I then saw how wrong I had been to avoid his presence, for he had that influence over me which invariably soothed me, and led me into his own mood while I was with him. But after he had left me, the strange torturing thoughts would come: Had he done right? Was this for the happiness of both? And day after day it was always thus. I was even more with him than before our engagement; for we were formally engaged, with the free consent of Mr Stanhope, pending only my uncle's reply to a letter from Mr Salkeld.

But as the days became weeks, I grew more and more to look at the future with hope and calmness. An earnest longing now possessed me to keep him with me at my side always, for with him was peace—peace of mind. Therefore, I opposed no objection to his wish for an early marriage. He left for his new living just about the time that my uncle's letter arrived, consenting to the match; and it was then settled that in one month our wedding should take place at the village church. After he left me, I was lonely, and not quite as I had been, but not unhappy, for I felt that all had been for the best.

He was greatly missed in the village, and I strove to soften his absence to his flock by endeavouring to do as he had done amongst them. Every day, as I went here and there to the cottagers, I knew that I was doing his will, and I thereby found pleasure and contentment. But a crisis came that almost prostrated me to the lowest depths of despair. Oh, how shall I describe the terrible torture of that most unhappy time—the self-reproach—the self-abasement of it!

Mr Salkeld had left us about a fortnight. It was early in the month of June, and I remember (so well I remember every word and deed of that day) I had been to Selwyn Grange; and Effie and I had had a long, long talk about many things, about everything that had interest for ourselves and those about us. Amongst other subjects Effie talked much of her brother, who was expected home that very day. It was the

time of the great French alarm, and the dear girl was troubled lest danger should come to him, for the militia were under arms and about to march southwards in a few days. Hence this visit home, which was to be a very short one, she said. Then we also talked of my approaching marriage, and made over again the arrangements for the ceremony which we had arranged many times before. I told her how happy I was to have won the love of a man like Arthur Salkeld; but in saying so I had to crush again the rebellious promptings of my heart—the indefinable rebellion which was now so surely fading down, and soon, I hoped, to be forgotten as a sickly dream.

I thought it strange that the feeling should have asserted itself in speaking thus to her; but I conquered myself, and walked home in the dusk in a happier frame of mind than usual, for the discussion of the ceremonious trifles which Effie took such strong interest in always helped to soothe me and restore the balance of my mind. It was a calm sweet evening, and as I walked down the chestnut avenue I heard the faint sounds of the clatter of a horse's hoofs in the distance; but the sound conveyed no idea to me, and I walked on absorbed in my own thoughts. But when I left the avenue for the high-road, these sounds of hoofs came nearer and nearer, and just as I turned a corner of the road the horseman appeared in view. In spite of the deepening twilight, I knew him at once. It was Arthur Selwyn! My heart seemed to stop at the sight of him, he seemed to come so suddenly. The next moment it was beating wildly and frantically, for he had dismounted and taken me by the hand, looking in my face anxiously. Heaven help me, how I thrilled at the touch of his hand and the sound of his voice! I trembled like a leaf, and withdrew my hand from his, and answered him coldly that I had been harassed of late by many things.

He turned—leading his horse—and walked by my side, and I made no effort to prevent him from doing so, for one look at his pained face—the worn, melancholy look of it—made me long to say a word of sympathy to him, and I said to myself, to my self-deceiving heart: 'This marriage of his is making him miserable indeed.' We walked together in painful silence, for I could not put into words my half-formed resolution; they seemed to die on my lips. He himself, however, introduced the very subject of my thoughts, for he turned suddenly to me, and said in a hard, tuneless voice, so unlike the voice that spoke to me but a minute before; but the hardness of it brought me to myself. The words were these: 'You have heard of my approaching marriage, Miss Wilfrid, I suppose? My sister is very free with her communications where I am concerned.'

'Dear Effie has told me,' I replied; 'and your sister loves you well, Mr Selwyn. You should not speak so.'

He looked straight at me for a moment, and his head drooped. 'She is my dear, dear sister,' he said, and was again silent. Then he broke out suddenly: 'Miss Wilfrid, I am a most unhappy man. There is no happiness for me in this black, unlovely world—nothing but misery!'

'Do not say that, Mr Arthur; it is sadly wrong. God's providence has made the world beautiful to those who follow the path of duty in it, and trust in Him.'

'You are an angel. There is nothing but brightness on earth where you are,' he said. 'But I—I think they are trying to make a demon of me. If I never had been born, or had died a year ago, it would have been better for all who know me.' He said this in such a voice and with such a wild look that I trembled for him; and oh, how I pitied him! My heart seemed to melt within me. I said nothing.

Then he went on in the same wild strain: 'And who are they, that they should compel me to stifle my own heart and fling happiness from me? Is there no escape for me?'

I felt that I had no right to say anything to this, although he looked hard at me as he spoke, as if for a sign. I know not if my eyes revealed anything to him beyond what I felt of pity for him and deep sympathy, for had I not also suffered! But the next moment he stopped in his walk, and spoke to me words which from my memory shall never be effaced while the heart within me throbs and life endures. He said, and how deeply earnest was his voice then: 'There is one way of escape. Miss Wilfrid, you can save! O Rose! is it not perceptible to you? It is you I love! I shall go mad, I think! My darling! you, and you only, can save me! I am a doomed man else. I can't express myself as I should. You, I love; and you I have loved from the first.'

I felt as if I had been turned to stone; and then, and then the scales fell from my eyes. I read my own agonised heart—my heart, that almost broke to hear those wild passionate words. Oh, what I endured in one short-lived moment! The love that had been growing and yearning within my inmost heart seemed as though it would burst the bonds of life, so like a flood it came in one swift rush of realisation. Loved him! His love was as nothing to mine. I worshipped him! I could have died that he might be happy, if my poor life could have done so much for him. But the next instant came the awful revulsion of feeling. My burning heart became ice. It was too late! I felt that my senses were leaving me. I must have staggered backwards, I think, for he reached out his arms to me with a short sharp cry; but I shrank from him, and would have fled away, could I have done so. I sank backwards against his horse, and clutched the saddle with my hands tightly, till I forced my reeling senses in a moment back again. He placed his hand on mine. I felt it tremble—and in a low whisper, he said: 'Dearest Rose, be my wife; you love me; fly with me now. Let us leave this cold marriage behind us. In two hours we can be across the borders, and then you are mine for ever.' His dark eager face bent over me; his hand clasped mine.

Oh, the temptation of that moment! Oh, that I had fallen at his feet, never again to rise with life! But no! A shadow seemed to come between us, and the pleading eyes of Arthur Salkeld, my betrothed, were in that shadow, and the trial of my strength was over.

'How dare you?' I almost shrieked. 'How dare you torture me like this? You! engaged as you are to one who will shortly stand with you at the holy altar!'

He started back with a moan that almost shook my resolution. 'O Rose, do you not see we are the betrothed in the sight of heaven? I have made a fatal mistake. Help me to prevent that

mistake growing into a crime; for a crime it would be if I married her.'

'I cannot. I tell you, I dare not!' I gasped. 'Have you not heard? I too am bound irrevocably.'

'I have heard nothing, Rose. What do you mean?'

'I mean that the banns were proclaimed last Sunday between Mr Salkeld and me. Mr Selwyn, my duty is clear. Yours is also. Let this be forgotten between us. Let us part now; and when we meet again, you will look back and regret the words you have spoken this day.'

As I said this he became as pale as death—I could see his face alter in the dusk—and he cried out: 'Never, never! You cannot love *him*—a parson, a preacher!'

The epithets stung me, and with a touch of anger I was made firm. 'You shall not insult him in my presence. Mr Selwyn,' I said, 'let me go;' and I turned down the lane quickly.

But he came by my side again, saying: 'You will not leave me, Rosy! Is there no hope for me?'

I did not hesitate then in my reply. Oh, my cruel, cruel heart, how could you do it? I answered: 'There is no hope!'

He spoke no more—a deep sob seemed to choke some word in his throat. He seized my hand and kissed it almost violently; then with a look of daring recklessness he threw himself upon his horse, and I heard him gallop into the night, but not in the direction of Selwyn Grange. The sounds of his horse's hoofs grew fainter and fainter, and he was gone.

How I got back to the vicarage I hardly know; I had but slight recollection until I found myself lying on a sofa with the vicar and Miss Stanhope leaning over me in great distress, for they thought that some serious attack of illness had overtaken me. So it had; for the next day I was unable to leave my bed, and I remembered nothing more for many weeks. And but for that merciful unconsciousness, I had died or lost my reason; for in those weeks news came to Selwyn Grange, such cruel news as would have scorched me like lightning.

When I became convalescent, Miss Stanhope told me all that had happened. The Selwyns never knew that Arthur had been so near to them that night; and a letter was shortly afterwards brought to them to say that he had volunteered into a line regiment under marching orders for Flanders. I saw that letter long afterwards, and one sentence in it went to my heart like the stab of steel: 'My duty is clear.' The very words I had said to him that fated evening!

Poor Effie was frantic with grief.

And then came the rumours of great armies on the continent, all in movement to unite against the fiend Napoleon. Lord Wellington had gone to Brussels to take command of the English forces, and a great battle was talked of as about to take place. But of Arthur Selwyn came not a word more. Then came the time when the news of battle and victory spread throughout England like flame. Triumph, anxiety, grief, and joy shook the hearts of all. One word was in every mouth—Waterloo! Then came the official reports in the newspapers; day after day the columns of news were long lists of wounded and slain. The

brave soldiers of Britain! And one day the blow fell upon Selwyn Grange: 'Lieutenant Arthur P. Selwyn dangerously wounded.'

When I lay in the first stage of my illness I was delirious, and one cry was on my lips day and night: 'Arthur, Arthur, come back to me!' They sent for Arthur Salkeld; and he came and watched by my bedside with the others, for it was thought I was near to death. He staid until the crisis of the brain-fever had passed, and I grew gradually conscious of life and reason. This was just about the time that my loved Arthur, my brave Arthur, fell in the dreadful fight; and I knew nothing of his fate, nor for long after, for I was so weak that no event of the outer world was allowed to reach my ears.

Little did they think at the time of the other great reason for that wise precaution. Ah! little did Arthur Salkeld imagine, while he sat there with my hand in his, and his true heart filled with grief, how deeply in my own heart I had injured him, and how fruitless was that wandering cry—the cry that went forth from my delirious lips for the love of another than him.

He did not come near me any more after the dangerous period had passed away from me, thinking that his presence might be hurtful to me; and I, the traitor to him, blessed him for that, for his noble self-denying thoughtfulness.

As I became stronger I reviewed the past, and I saw how grievously I had sinned against Arthur Salkeld. But my heart's desire had been revealed, and the resolve grew with returning health that I would not do him the still greater wrong of becoming his unloving wife. Sooner death than that. My fault should not become a crime. He had not yet left the vicarage, nor would he leave without seeing me, he had said; I had feared this, and like a coward, I shrank from and dreaded the interview.

In the meantime a letter had arrived at Selwyn Grange. Arthur still lived, although badly wounded. A brother-officer had written the news, and he wrote in glowing terms of Arthur's bravery. A detachment of his regiment had stormed some building in the battle-field held by the enemy, and had driven them out; but the building had caught fire, and the dastardly French cavalry had again surrounded the place, cutting down the brave English as they forced their way out. But my Arthur fought over the body of a wounded comrade and defended the colours till help came, just in time to save him from being destroyed by the flames, but not in time to shield off the cruel French bullets. My heroic Arthur!

Mr Salkeld's continued stay at the vicarage made me feel very uneasy in my mind. I could no longer remain in my bedroom, and I dared not meet him after what had passed between myself and Arthur Selwyn. I wrote him a letter, a letter which took me a whole day to write, although it was not a long one. How could I tell him that I declined his love? In what way could I extricate myself from the cruelly false position in which my own blindness and wretched folly had placed me?

It was a terrible task to perform, for well I knew the blow that would fall upon him. But I could not have told him personally; no power in the world could have driven me to that. The strange influence he always exerted over me would alone

have defeated me utterly. So in my letter I told him all : I hid nothing from him ; I did not plead ignorance of my love for Arthur Selwyn. I threw myself on his mercy.

He did not immediately reply, not for two days. I was in wretched suspense, but on the third day I received the following letter from him, which ran thus :

'DEAR MISS WILFRID—I could not reply at once to your letter. Your sympathising woman's heart will tell you why I could not. Oh, it is hard to give you up! God knows, before whom my spirit is bowed, how I have suffered these last two days. But, dear Rose, I love you too well to sacrifice your young life to my selfish happiness, or to ask you to do so, knowing now what I do. I shall lose the brightest jewel of my life in losing you; but do not sorrow for me. I know your gentle nature too well not to know that this has cost your kind heart a deep pang. But let not my memory come, cloud-like, between you and your future life, wherever or whatever it may be. For was it not altogether my doing, this sad, sad business! Mine was the fault. I go now into the busy world of a large town; into the midst of many and pressing duties. I shall carry with me the remembrance of this love—for I cannot forget—as I would a sacred memory. And it would be better, much better for both of us never to meet again on earth. God bless and guard you from all harm. Farewell!'

That letter was bathed with my remorseful tears. The noble unselfishness of it, and the tender care for my happiness. Most unhappy I was that sad day. Had I not wronged and slighted the gentlest heart in England! And he, whom I really loved, was lost to me, lost! driven from me by my own words, in that memorable summer twilight.

Thus I lay crying and sorrowing one long night, and at daybreak I arose and walked the room in agony. I was nearly mad. I opened the window, to let in the pure morning air, and leaning there, with the sweet roses curling round me, in my soul I prayed for guidance. I prayed for both the men whom I had brought to misfortune, and for forgiveness for my wrong-doing. As I knelt there, I heard once more the silvery song of the lark, as if a voice of *hope* from heaven spoke to me; and then came the blessed relief of tears, and I arose with patience in my heart.

Shortly afterwards I went with Miss Stanhope to Scarborough, and staid there about two months; and about the end of that time we heard from Effie that her brother had been brought home to the Grange. She wrote but a short letter, and seemed in much grief, for Arthur had not recovered from his wounds. But there was a mystery about what she said that I could not understand, and apprehension seized me that some new calamity was impending. It made me more and more unhappy; indeed I had never been myself since my illness.

Effie knew nothing of my love for her brother. I knew well that her approval was sure; but I knew also that it would have set her once more against her mother's wishes.

One Saturday night, after we had returned, Miss Stanhope called me to her and said: 'Rose, dear, Arthur Selwyn is to be at church to-morrow. Mr Selwyn told my brother so yesterday.'

'Thank God, that he is so well!' I exclaimed.

'My dearest Rose,' said the good old lady, 'you must be prepared for a great shock, as he is greatly changed. I must tell you, Rose, for I cannot leave you to meet him in ignorance of his great misfortune.'

I gasped for breath.

'You remember the officer's letter about the fighting amongst those horrid flames, dear?' she continued. 'Those flames have injured his eyesight.'

'Dearest Miss Stanhope,' I cried out, 'I know what you would tell me. He is blind! O God, be merciful to me, for I have done this!'

'Not so, my dear: it is His will; and what are we that we should question it!' So the old lady comforted me in my misery. Then I knew the mystery of poor Effie's letter.

Oh, how my love went out to him when I saw him enter the church that day, leaning on his father's arm—my boundless love! O Arthur, Arthur! I waited for him at the door and, before them all, I took his hand in mine. He knew me before I spoke, and a faint flush lighted up his pale haggard face. He said little; but I knew that his heart was unchanged, and changeless.

No consideration could now stay me. I gave myself up to loving him—loving him in secret, for I saw him no more until the next Sunday, and then only for one blissful moment. I was happy.

One day Effie came to me breathless. 'O Rosy, dear,' she said, kissing me, 'I know all. Poor Arthur has told me all about everything. He could bear it no longer; and you must be friends, you two.'

'But Mrs Selwyn, dear Effie?' I said.

Effie's face clouded in an instant. 'She will not interfere between us,' she replied. 'All her schemes for my dear brother are over now. She has scarcely ever spoken a word since Arthur came home, but goes about the house with a dreadful, dreadful look in her face. Poor mamma! She thought she was doing all for the best. And the Cressfords have deserted us; all except Gavin, poor fellow; and he comes as often as he dare, for he is greatly in awe of mamma. And, dear Rosy, it is pitiful to see mamma following Arthur about the rooms and the gardens, but always at a distance, as though she dared not be in his presence.'

The result of this conversation was that I went to Selwyn Grange, and there was Arthur sitting near Effie with a shade over his sightless eyes. Mrs Selwyn sat pale and wretched-looking. Arthur greeted me in his own dear voice, as when we were all happy together; the voice that had had the power to thrill me so. Effie soon contrived that we should have a corner to ourselves. How happy, and yet how sad I felt to sit there near him who was my world, my life! I inquired after his health. I knew not what else to say to him.

'I am recovering strength,' he said; 'but the loss of my eyesight frets me so.'

We talked chiefly, after this, on subjects apart from ourselves; and before long his Christian name, engraven as it was on my heart, fell from my tongue. I could not stay it.

His face flushed instantly with pleasure. 'O Rosy, dearest Rose, you forgive me?' he said.

My heart was so full I could scarcely reply: 'Arthur,' I said, 'oh, how can you ever forgive me? Am not I the cause of this?' Then came

my tears—tears of joy and sorrow both; for I felt that my heart was nigh breaking—breaking for him. But his arms were folded round me, and my head sank on his breast.

'Let us not talk of forgiveness, darling!' he said. 'I am a happy and thankful man to be listening to your dear voice to-day. The thought that I could not ever be anything to you has borne me down more than all; for I could not cut you out of my heart, hopeless though my love for you seemed. My only pleasure left was always to think of you, for I once thought you loved me a little. Ah! Rose, I ought to have told you of my love sooner.'

The joy of perfect happiness seemed to possess me as I heard him speak like this; and my tenderness, so long imprisoned, flowed out to him in the sacred words of love.

It was not long before Effie came back. She stooped and kissed me in silence. Arthur smiled and held out his hands to her, and she kissed him again and again. I heard a convulsive smothered sob somewhere in the room, and looking round, I saw Mrs Selwyn going out at the door. My heart bled for her, and I thought, here was my duty of reparation to Arthur—to heal the broken love between these two—to close the dreadful gulf which had grown betwixt mother and son.

One day I addressed Arthur on this subject; but from what he said I feared it would be a hopeless task. Mother and son could never be to each other what they once were.

Day after day and month after month passed away like a dream. Arthur and I met every day with the free consent of everybody, for the lessons of Fate had told heavily on the austere exclusiveness of Mrs Selwyn. She and I were friends for Arthur's sake. Even Arthur and she had become reconciled. It came about on the day of his father's funeral; for another affliction had fallen upon Selwyn Grange. Mr Selwyn—to whom everything except his own pleasure was as nothing—was dead. Let his memory rest. His death was sudden and awful—the old sad story of death in the hunting-field.

After that sad event, the affairs of the ruined estate were finally wound up, and a few hundreds a year were left out of the wreck for Arthur and his mother. They sold the land, and moved to a smaller house on the estate of Gavin Cessford, whose wife Effie had become a few months before. Their wooing was a strange one. Effie often told me, in her light, joyous way, that all the talk was hers and all the sighing his. She had refused him many times, but his faithful love won her at last. Dear Effie! She has a little Gavin now, and a little Rosebud also.

Two years passed away. I need not write in detail of their quiet uneventful happiness; but at the end of those two years I was Arthur Selwyn's wife. We lived, his mother and ourselves, together, for Mrs Selwyn could now scarcely endure to have him out of her sight.

Arthur! Beloved! Two lonely broken-hearted women are living now in the sad dark house of mourning, that was once glad with our wedding-day—alone, and sorrowfully awaiting the end. More than mother and daughter are they, for thy grave unites them. One happy, happy year of health was vouchsafed to my dear husband after our marriage, and then surely and slowly he faded

away from us. Oh, the unutterable agony of those months to me—his six months of torturing illness! The gleams of hope that would one day visit us, to be extinguished the next. How I lived through it I cannot tell. I think his noble example strengthened me to bear and to suffer as he did—in silence. But the inevitable day came, and in these arms he died.

My Arthur! May I be forgiven that in that dark hour my spirit rebelled against the decree of Heaven. May God forgive my erring soul! And may He, in His pardoning mercy and loving-kindness, open soon to my wearied eyes the gates of Life—the Life which is eternal! J. C.

STOCK-RAISING IN THE FAR WEST.

THE continually increasing demand for fresh beef has led, as is generally known, to expedients for bringing live oxen from the United States and Canada. It cannot yet be said that this import trade has attained large dimensions, but that it may some day be eminently successful is far from improbable. In the meanwhile, the rearing of stock in the Far West for this kind of trade is being prosecuted with vigour, and is said to offer extensive scope for enterprise. A settler on the eastern slopes of the Rocky Mountains sends us some particulars regarding stock-raising in that quarter, which we give pretty much in his own language.

'The cattle business in the western part of the United States offers great opportunities of well-doing for energetic young men with a few hundred pounds in their pockets, and who do not mind leading a somewhat rough life in a wild uninclosed country. Though rough, the life is not unenjoyable. The rounding in, herding, and driving of cattle; the exuberant spirits and feeling of thorough freedom, can nowhere be enjoyed to such perfection as when swiftly coursing on horseback over the great stretches of the boundless plains. In addition to this, the profits of the trade are large, and with a fair amount of good fortune, capital goes on accumulating year after year, almost beyond the owner's ability to reckon. Of course there is luck in this as in all other occupations, and a man starting with a small capital might, if not careful, lose the best part of his herd by stampede or disease, and so be swamped at the outset; but where a strict watch has been kept, and the eye of the owner always over his stock, in no instance have I known a failure to acquire success and ultimate wealth.

'The great cattle-ranges of North America stretch from Montana on the north to the Rio Grande, the southern boundary of Texas, on the south, including Western Nebraska, Kansas, and Dakota, and Eastern Wyoming, Colorado, and Montana. With the exception of Texas, where the land is mostly well fitted for agriculture, and which will be covered before many years with a network of railways, and consequently inclosed farms, these other states and territories are specially adapted by nature as the home of the stock-raiser. Here the conditions of situation, climate, and soil are such as to prevent the development of agriculture, manufactures, and commerce; while the arid plains and successive ranges of mountains will render these regions the future natural home of the herdsman and shepherd.

'At present, undoubtedly Texas is the great cattle state of the country, but how long it will remain so is merely a question of time. Already has the extension of crop-raising settlements increased the value of land and restricted free pasture; and eventually the stock-raising interests will be driven to the northern buffalo grass region, which Nature seems to have specially reserved for this purpose.

'Since the rebellion, through causes arising from the war, the immigration into Texas of white and coloured people from the South has been great, and is rapidly increasing; and they have not been slow to find out the high agricultural qualities of the land, and turn the same to good account. Thus the eyes of the public in all parts of the United States have been attracted to this remote corner of the country.

'The experience of stock-growers from all sections for the last few years has proved that the pure bracing air of these more northern territories east of, and adjacent to the slope of the Rocky Mountains; the peculiar virtue of the sweet, nutritious buffalo grass, their equable climate, and the pure water of the mountain streams furnish the conditions of perfect animal health and vigour of constitution for growing stock, not enjoyed by any other portion of this continent. Intelligent investigators are aware of this fact, although the masses do not seem to realise it as yet.

'The climate has no extreme of heat and cold, and the atmosphere is pure and bracing, the mean annual thermometer being at Denver, the centre of the line of this region, about fifty degrees, and the annual rainfall about thirteen inches.

'The rainy season is in May and June, when vegetation grows with great luxuriance; and when the rains cease, the grasses gradually dry on the ground, and become perfectly cured, mown hay, and remain in this state all winter. It makes far better feed than cut hay, and all the expense of cutting and stacking is saved. On an average, about two feet of snow falls in the year, a little at a time; and cattle and sheep can graze, with few exceptions, both winter and summer. A small provision for the few severe days of an unusual snowfall is, however, generally made by the provident.

'A great part of all these states and territories consists of what is here called wild land, that is, not owned by any private individuals. The greater portion belongs to the government, or has been granted by it to the railroad companies, so many miles on each side of their roads. Land can therefore be purchased on long time from the railroad companies, and a sound title given for the same; or it can be acquired under the Homestead law from government, which permits every head of a family, or male over twenty-one years of age, who is a citizen of the United States, or has declared his intention to become one, to pre-empt or enter upon a homestead of one hundred and sixty acres in any part of the public lands, for which a patent is issued after five years' residence on the same, and the payment of one dollar twenty-five cents per acre. With this centre of operations upon which to build his home and make his improvements, the adjacent wild land is all open as a range and feeding-ground for the settler's stock. The cost of raising a three-year-old steer out west is calculated at five dollars, or about twenty

shillings sterling, including all expenses, which is certainly a small sum, all things considered.

'The whole of these pasture-grounds on the eastern slope of the Rocky Mountains have the advantage of transportation near at hand by either the Union Pacific or Kansas Pacific railways; which Texas, where cattle must be driven seven hundred miles for shipment, has not. At present the local demand, owing to the thousands of men who are pouring into the newly discovered mining districts, is even greater than the supply, and producers can find a home market for all the cattle they can furnish. For the benefit of those who have ever thought of embarking in stock-raising in the United States, and who desire to know a little of the new Eden before bending their hopeful steps that way, I have offered the foregoing information; and to it I will add a little advice, which from experience I am able to give, and which they would do well to follow.

'During four years that I spent in Uruguay and the Argentine Republic in South America, each succeeding steamer of the Landport and Holt line from Liverpool brought out to the river La Plata a crowd of young men from the old country— younger sons, retired officers of the army and navy, and others with a few hundred pounds capital, bent on making their fortunes at sheep-raising. We used to call them "heaven-born sheep-farmers," for the majority could not tell a ewe from a wether. Some few were successful, as they had the energy, grit, and good sense to be so anywhere; but more went home again empty-handed. Now their fault was this: they would come as far as Monte Video or Buenos Ayres, where they put up at the best hotel, and remained there a month or so playing pool, billiards, &c., with the mistaken idea that they were seeing what the country was like; or else they were making up their minds where next to go, what to do, and how to do it. They had no definite plan mapped out when leaving home, and so they wandered in an aimless way about the country prospecting, until their capital was so shrunk as to be well nigh useless; instead of going to work at the first chance they got as a working shepherd, and so learning a little of the business they had come to make their fortunes in, and of which they were perfectly ignorant.

'Whoever comes out to our western country may expect to have plenty of hard work to do, and turn into bed many a night thoroughly tired out, and find very little romance about it at first; but hard work is the only honest and manly road to success here. The less money a man brings with him the better, for he will be more likely to get to work at once, and learn the details of his business. Whatever capital he has to invest should be left behind him, until he has had at least six months' experience as a hired herder on some large cattle ranch, and then he won't be tempted to invest money in fancied opportunities until his self-imposed term for acquiring instruction and experience shall have expired. He must have made up his mind to begin thus at the foot of the ladder, or he will not succeed; and he must expect to find some pretty rough characters among his new comrades, with whom he cannot put on any airs, or endeavour to assert any superiority, for though, as a rule, open-hearted, generous, and true as steel, they are quick to take offence, and the quickest man to draw his Colt's revolver settles the

difference in his own favour. However, as long as a man minds his own business, keeps sober, and is courteous and obliging to those around him, he need not fear but that he will find the settlers to be good fellows, and always ready to give him a helping hand, and teach him what he wants to know. He will meet all grades of society, and many educated men among them, who have dropped into their ranks through the love of wandering innate in the American, under the impulse of the well-known advice of the late Horace Greeley, "Go west, young man."

The writer concludes by recommending young men bent on trying their luck in the West, not to trouble themselves with letters of introduction from Emigration Agency Companies and free information offices in England to 'influential people' in the United States or Canada, though he sees no reason against purchasing through tickets from such agents, especially as they are to be had at a reduced price. Letters of introduction from such companies are, says our writer, 'a snare and a delusion.' Nor should they bring more luggage than will fill a portmanteau, and by all means not loiter in towns by the way. Considering the unsettled state of society, we would hesitate to follow up the advices of the writer, further than to say that the young and adventurous with a taste for cattle-raising might do worse than try their fortune in the quarter of the world here recommended. Of one thing there can be no doubt. The growing demand for fresh meat not only in the Eastern States of the Union, but in England, gives promise of a lucrative system of stock-raising in the Far West.

THE MONTH:

SCIENCE AND ARTS.

OUR scientific and learned Societies having got through the first weeks of their session, are preparing during the Christmas holidays for a fresh start in the New Year. Among subjects brought before the Royal Society were 'Experimental Contributions to the Theory of the Radiometer,' by Mr Crookes, in which the peculiarities of the remarkable instrument are explained more clearly than before, and a way is opened for further investigation. We have already described the radiometer in these pages; hence for the present, it will suffice to state that by modifications of the form and material of the rotating discs, very curious effects are produced; that the mill may be made to stand still by improved exhaustion of the glass case, and that in a perfect vacuum (if such could be produced) the beam of the torsion balance 'would be in perpetual motion.' There will be more to explain on this subject before the session is over.

A paper by Mr G. H. Darwin, son of the eminent philosopher and naturalist, discusses the question of the fixity or mobility of the earth's axis of rotation, and the possibility of variations in the obliquity of the ecliptic—a question which has of late attracted much attention. The sum of the argument is, that if the earth be quite rigid, no redistribution of matter in new continents could ever cause the deviation of the Pole from its primitive position to exceed the limit of about three degrees. But if it be true that the earth

readjusts itself periodically to a new form of equilibrium, then there is a possibility of a cumulative effect; and the Pole may have wandered some ten or fifteen degrees from its primitive position, or have made a smaller excursion and returned to near its old place.

With regard to the obliquity of the ecliptic, no such cumulation is possible. As Mr Darwin remarks, even gigantic polar ice-caps during the glacial period could not have altered the position of the Arctic Circle by so much as three inches. Thus the obliquity of the ecliptic has remained sensibly constant throughout geological history.

How to account for the presence of fossils of tropical animals and plants in the polar regions, is still a difficulty. A recent suggestion by way of overcoming it is, that in the primeval ages the bulk of our atmosphere was much greater than at present, whereby the warmth of the earth would be preserved and extended into regions which are now subject to perennial frost.

The anniversary meetings of the Royal Society may be regarded as records of the progress of science, for the President makes known what has been done during the year, and in presenting the medals, sets forth the reasons for the several awards. Thus at the last anniversary, the Copley medal was given to Claude Bernard, a famous French physiologist, for his discovery of the sugar-making function of the liver, which opened entirely new views of the animal economy, and helped to advance the science of physiology. Formerly it was thought that the liver had nothing to do but secrete bile; now we know that chemical actions of different nature are being carried on at the same time with such results as to make of the liver, as has been happily said, 'the sweetener of life.' The study of these actions ranks among the most interesting of physiological inquiries.

By means of the spectroscope our knowledge of cosmical science has been greatly extended; and another Frenchman, M. Janssen, was singled out for the Rumford medal, for his many contributions to spectroscopy—a science as yet in its infancy, but full of promise. He was in India observing the eclipse of 1868, when, with a flash of genius, it occurred to him that an eclipse is not necessary to enable astronomers to take observations of solar phenomena, but that by a proper arrangement of the spectroscope the ragged edge of the sun—which presents such important phenomena—can be observed on any clear day.

A Royal medal was given to Mr William Froude, F.R.S., for his theoretical and experimental researches on the behaviour of ships. These researches were carried on by means of excellent instruments of his own invention, with which he measured the oscillations or 'rolling' of ships. In a country which depends so much on its navy as England, it is of the highest importance to know all that can be known about ships and their behaviour, and on questions of form of resistance, or propulsion, Mr Froude's mechanical skill and theoretical acuteness place him in the foremost rank as an authority.

In her voyage round the world of three years and a half, the *Challenger* sailed nearly sixty-nine thousand miles; made hundreds of soundings, ascertained the nature of the sea-bottom over enormous areas, collected thousands of animals and plants from land and sea, made long series of

observations on temperature and currents, discovered facts which throw light on important geological questions, and increased our knowledge of the physics and natural history of the globe to a surprising extent. Sir Wyville Thomson, F.R.S., was Director of the scientific staff by whom all this work was accomplished; and by awarding him one of the two Royal medals for the present year, the Royal Society have expressed their opinion of his merits. Many readers will be glad to know that measures are in progress for publishing the history and results of this memorable voyage.

A German chemist has made a long series of careful experiments to ascertain the quantity of carbonic acid given off in respiration and perspiration by different animals. From among his most important conclusions printed in the *Journal* of the Chemical Society, we select a few which appear worth wider notice. In proportion to their weight, the largest quantity of carbonic acid is given off by birds—mammals come next—and worms, amphibia, fishes and snails form another group in which the excretion of carbonic acid is much smaller: of these, worms give off the most, and snails the least. Those that live in water give off more carbonic acid to the air than they do to the water; and young animals more than old ones. Experiments with coloured light shew that under the green and yellow more carbonic acid is excreted than in ordinary daylight; and on comparing light and darkness, it was found that much less carbonic acid is given off during the night than during the day. In coloured light the milk-white and blue rays come next to the green and yellow in activity; and the red and violet are the least active.

The same *Journal* publishes a statement concerning the action of sea-water on lead: 'Freshly cut strips of lead were kept in a bottle of sea-water for four days, the bottle being frequently shaken. No trace of lead could be detected in the water, but the bright surface of the strips was coated with an insoluble lead compound. Hence lead pipes may be used in marine aquaria without any fear of injury to their inhabitants.'

A series of lectures on the Laws of Health is in course of delivery at the Society of Arts, elucidated by clever experiments. The lecture on Digestion was especially remarkable, for the process of digestion was shewn in glass vessels by chemical means which a few years ago would have been thought impossible. Solid meat and chopped meat were dissolved, before the eyes of the audience to exemplify the action of the gastric juice, and the necessity for and advantage of mastication.

In the state of Durango, Mexico, about nine thousand feet above the sea, there is a remarkable tin-bearing district more than twenty miles in extent, concerning which a few particulars have been made public. By sinking of shafts it has been ascertained that stream tin and ore abound over the whole district. The ore is found loose in the veins in irregular rounded masses from the size of a pin's head to that of a man's head; and the supply is so great that 'metallic tin can be produced at a cost of two cents a pound.' There are six hundred veins already known, and more than three hundred drifts of stream tin. A visitor to the spot is of opinion that the tin ore is still forming. A portion of a vein was left

standing in 1864. On examining the place in a subsequent visit in 1870, he found that 'new films or layers of cassiterite had been deposited, and in some places noticed that peculiar variety known as toad's-eye tin, which he believes had formed during his absence.'

It is not difficult to believe that digging has never been held in such esteem as in the present century, for to say nothing of the tons of gold and silver and of other minerals which have been dug out of the earth within the past fifty years, many chapters of ancient history have been brought to light by digging in various parts of the world, and our knowledge of the arts and architecture of bygone ages has been increased. Nineveh and Babylon have been made to reappear and give up their treasures. Travellers to Jerusalem may now see portions of the city as they stood in the days of David and Solomon: grand historical buildings of the Rome of the emperors have been disinterred; and at Troy, Dr Schliemann has discovered cities more ancient than the Ilium described by Homer. Since then, while digging at Argos he found the tombs of Agamemnon and other ancient heroes, containing bones, utensils, golden sceptres, and jewelry of matchless workmanship. Discoveries not less important have been made by General di Cesnola in Cyprus: sculptures by thousands in marble and alabaster; numerous gems, ornaments in bronze, terra-cotta; rings and armlets of massive gold; more than two hundred delicately worked articles in silver, at least two thousand years old; and the official seal of Thothmosis III. king of Egypt, who conquered Cyprus in the days when his subjects were building the third and fourth Pyramids. This seal is perfect, and is described as 'a finely cut stone, pierced and mounted in gold, with its ancient movable handle of silver.' Among all these what admirable specimens there will be for modern museums! And more may be expected, for the researches will be continued. In the progress of his work the General has identified the sites of seventeen ancient cities, one of which is Kitium, the Chittim of the Bible. And last we hear of the discovery of ancient towns and golden ornaments in the wild sandy Desert of Gobi in Eastern Turkestan, an account of which was recently read at a meeting of the Royal Geographical Society.

To these particulars we may add the interesting fact, that in the series of translations from ancient Egyptian papyri preserved in the British Museum, one has just been published which shews that much intercourse—not always peaceful—prevailed between Egypt and the islands of the Mediterranean.

The last number of the *Journal* of the Bombay Branch of the Royal Asiatic Society contains an article on the 'Beliefs and Usages among the Pre-Islamitic Arabs' which is well worth reading, for there is much in the history of those early days analogous to Biblical ancient history. They appear to have in fact much in common, and the Scripture names are recognisable in their Arab dress. The subject is full of interest, and will probably have more light thrown upon it if ever the 'great ruins of Yemen' should be excavated. It will perhaps surprise some readers to learn that much of what is called Mohammedanism existed before Mohammed. He found usages and beliefs in full force, and adopted them; as, for example, the pilgrimage

to Mecca, the kissing of the black stone, the running between Cafa and Merwah, and the sacrificing of cattle.

The year just closing will be memorable for many forms of intellectual activity, for multifarious discussion on matters appertaining to education, for advocacy of endowment of research, and for decay of the feeling that knowledge is worth acquiring for its own sake alone. For example, we have an archbishop delivering prizes to successful students at Manchester, and telling them that, by far too much of our public-school education is taken up with Latin and Greek, and a very little of the sauce of mathematics: that the ancient classics as a whole are by no means the splendid models of form and taste which they had been held to be: and that modern German, French, and English offer resources for acquiring knowledge, for the building up of a refined form, and an elevated style, in a higher degree than the languages of antiquity. The anatomy of a modern language is a study of exhaustless interest, and as much intellectual acuteness may be developed in construing Shakspeare as in construing Horace. Then, again, we have the President of the Epidemiological Society endeavouring to remove popular error by calling on an audience of the medical profession to abandon 'semi-mystical speculation,' and to look on epidemic in its true light. 'The use of the word epidemic itself,' he said, 'was probably a necessity of medicine; but it should be used only in its common and natural sense to signify common to or affecting a whole people, or a great number in a community; and all mystical notions with regard to it should be wholly laid aside. It is the disease that constitutes the epidemic, and not the epidemic the disease.'

With regard to Messrs Sharp and Smith's apparatus for converting sea-water into fresh, noticed in this *Journal* for November 4, and which we believe was the invention of Mr A. P. Sharp of Dublin, we have to inform our readers that further information may be had by applying to the manufacturers at 36 West Ferry Road, Millwall, London; at 3 York Buildings, Dale Street, Liverpool; or at 21 Eden Quay, Dublin.

THE ROBIN.

E'en Dawn descends enrobed in silvery light,
 When hoden gray enshrouds the garden walls,
 And phantom trees are clothed in grizzly white,
 And Silence quivers as the dead leaf falls,
 Invisibly thou haunt'st the spectral gloom,
 Trilling lone matin-songs o'er Summer's tomb,
 Elegiac, as if the dawn of doom
 Premonitory toned thy canticles.

Hail! winged prophet of the stark white sleep;
 As Spring, the cuckoo greets, thy bode we hear
 Of Winter, though thy confères silence keep.
 From dawn till eve, thou wait'st the drooping year.
 And hark!—such cadences were affectionation,
 Did human voice intone such lamentation;
 Now; more thou savour'st of resignation,
 Seeing Nature's face each dawn more pinched and drear.

Brave nursery pet of legendary lore
 And greenwood fame, thy name's beloved, thy dnn
 Red-breasted coat hath shewn since times of yore
 A hero's heirloom, marked with victory on.
 But Robin, why so piteous a repiner?
 The common lot? No 'wood-note wild' is finer
 On Winter's verge, than thy delicious minor:
 Be Contemplation's soul in unison.

Ah, ah! an elfin flight; what tricky sprite
 Possesses thee to cut so quaint a caper?
 Did hapless emmet tempt thy appetite
 To strike with mandible of lethal taper?
 Or did the flattering sunbeams nerve thy wing,
 And touch thy breast, with amours of the Spring?
 And turn thy head with vain imagining
 Of plumes *d'er* bright, and spirits *always* happier!

Well, take thee all in all, thy fame and thee,
 Of winged guests thou art the versatile,
 All Summer long thy gallant lance is free,
 And then in Autumn-shrift thou dost beguile.
 Hail! welcome to our Yule-tide cheer;
 Welcome as praise to Contemplation's ear,
 Lonely as herald of the vernal year—
 And when all stark lies Nature dim and drear,
 May Vesta's bounty cheer thy heart awhile.

Volume XIII. of the Fourth Series of CHAMBERS'S JOURNAL is now completed, price Nine Shillings.

A Title-page and Index, price One Penny, have been prepared, and may be ordered through any bookseller.

An elegant cloth case for binding the whole of the numbers for 1876 is also ready.

Back numbers to complete sets may at all times be had.

Next Saturday, January 6, 1877, will be commenced in this JOURNAL, a NOVEL, entitled

THE LAST OF THE HADDONS.

By MRS NEWMAN,
 Author of *Too Late*, &c.

(Would Mr Spooner kindly communicate his address to the Editor?)

END OF THIRTIETH VOLUME

Printed and Published by W. and R. Chambers,
 47 Paternoster Row, London, and 339 High Street, Edinburgh.

Recd. 26.12.72
